# STM32F205xx
STM32F207xx

ARM-based 32-bit MCU, 150DMIPs, up to 1 MB Flash/128+4KB RAM, USB OTG HS/FS, Ethernet, 17 TIMs, 3 ADCs, 15 comm. interfaces & camera

Features

- Core: ARM 32-bit Cortex™-M3 CPU with Adaptive real-time accelerator (ART Accelerator™) allowing 0-wait state execution performance from Flash memory, frequency up to 120 MHz, memory protection unit, 150 DMIPS/1.25 DMIPS/MHz (Dhrystone 2.1)
- Memories
  - Up to 1 Mbyte of Flash memory
  - Up to 128 + 4 Kbytes of SRAM
  - Flexible static memory controller that supports Compact Flash, SRAM, PSRAM, NOR and NAND memories
  - LCD parallel interface, 8080/6800 modes
- Clock, reset and supply management
  - 1.8 to 3.6 V application supply and I/Os
  - POR, PDR, PVD and BOR
  - 4 to 26 MHz crystal oscillator
  - Internal 16 MHz factory-trimmed RC (1% accuracy)
  - 32 kHz oscillator for RTC with calibration
  - Internal 32 kHz RC with calibration
- Low power
  - Sleep, Stop and Standby modes
  - V_{BAT} supply for RTC, 20 × 32 bit backup registers, and optional 4 KB backup SRAM
- 3 × 12-bit, 0.5 µs A/D converters
  - up to 24 channels
  - up to 6 MSPS in triple interleaved mode
- 2 × 12-bit D/A converters
- General-purpose DMA
  - 16-stream DMA controller with centralized FIFOs and burst support
- Up to 17 timers
  - Up to twelve 16-bit and two 32-bit timers, each with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input
- Debug mode
  - Serial wire debug (SWD) & JTAG interfaces
  - Cortex-M3 Embedded Trace Macrocell™

LQFP64 (10 × 10 mm)
LQFP100 (14 × 14 mm)
LQFP144 (20 × 20 mm)
LQFP176 (24 × 24 mm)[(1)]

UFBGA176 (10 × 10 mm)

WLCSP64+2 (0.400 mm pitch)

1. Package not in production (for development only).

- Up to 140 I/O ports with interrupt capability:
  - Up to 136 fast I/Os up to 60 MHz
  - Up to 138 5 V-tolerant I/Os
- Up to 15 communication interfaces
  - Up to 3 × I^2C interfaces (SMBus/PMBus)
  - Up to 4 USARTs and 2 UARTs (7.5 Mbit/s, ISO 7816 interface, LIN, IrDA, modem control)
  - Up to 3 SPIs (30 Mbit/s), 2 with muxed I^2S to achieve audio class accuracy via audio PLL or external PLL
  - 2 × CAN interfaces (2.0B Active)
  - SDIO interface
- Advanced connectivity
  - USB 2.0 full-speed device/host/OTG controller with on-chip PHY
  - USB 2.0 high-speed/full-speed device/host/OTG controller with dedicated DMA, on-chip full-speed PHY and ULPI
  - 10/100 Ethernet MAC with dedicated DMA: supports IEEE 1588v2 hardware, MII/RMII
- 8- to 14-bit parallel camera interface: up to 27 Mbyte/s at 27 MHz or 48 Mbyte/s at 48 MHz
- CRC calculation unit, 96-bit unique ID
- Analog true random number generator

1 Introduction

This datasheet provides the description of the STM32F205xx and STM32F207xx lines of microcontrollers. For more details on the whole STMicroelectronics STM32™ family, please refer to *Section 2.1: Full compatibility throughout the family*.

The STM32F205xx and STM32F207xx datasheet should be read in conjunction with the STM32F20x/STM32F21x reference manual.

For information on programming, erasing and protection of the internal Flash memory, please refer to the STM32F20x/STM32F21x Flash programming manual.

The reference and Flash programming manuals are both available from the STMicroelectronics website *www.st.com*.

For information on the Cortex™-M3 core please refer to the Cortex™-M3 Technical Reference Manual, available from the *www.arm.com* website at the following address: http://infocenter.arm.com/help/index.jsp?topic=/com.arm.doc.ddi0337e/.

2 Description

The STM32F205xx and STM32F207xx family is based on the high-performance ARM® Cortex™-M3 32-bit RISC core operating at a frequency of up to 120 MHz. The family incorporates high-speed embedded memories (Flash memory up to 1 Mbyte, up to 128 Kbytes of system SRAM), up to 4 Kbytes of backup SRAM, and an extensive range of enhanced I/Os and peripherals connected to two APB buses, two AHB buses and a 32-bit multi-AHB bus matrix.

The devices also feature an adaptive real-time memory accelerator (ART Accelerator™) which allows to achieve a performance equivalent to 0 wait state program execution from Flash memory at a CPU frequency up to 120 MHz. This performance has been validated using the CoreMark benchmark.

All devices offer three 12-bit ADCs, two DACs, a low-power RTC, twelve general-purpose 16-bit timers including two PWM timers for motor control, two general-purpose 32-bit timers. a true number random generator (RNG). They also feature standard and advanced communication interfaces. New advanced peripherals include an SDIO, an enhanced flexible static memory control (FSMC) interface (for devices offered in packages of 100 pins and more), and a camera interface for CMOS sensors.

- Up to three I^{2}Cs
- Three SPIs, two I^{2}Ss. To achieve audio class accuracy, the I^{2}S peripherals can be clocked via a dedicated internal audio PLL or via an external PLL to allow synchronization.
- 4 USARTs and 2 UARTs
- An USB OTG full-speed and a USB OTG full-speed with high-speed capability (with the ULPI),
- Two CANs
- An SDIO interface
- Ethernet and the camera interface available on STM32F207xx devices only.

The STM32F205xx and STM32F207xx family operates in the –40 to +105 °C temperature range from a 1.8 V to 3.6 V power supply. A comprehensive set of power-saving mode allows the design of low-power applications.

The STM32F205xx and STM32F207xx family offers devices in four packages ranging from 64 pins to 176 pins. The set of included peripherals changes with the device chosen.

These features make the STM32F205xx and STM32F207xx microcontroller family suitable for a wide range of applications:

- Motor drive and application control
- Medical equipment
- Industrial applications: PLC, inverters, circuit breakers
- Printers, and scanners
- Alarm systems, video intercom, and HVAC
- Home audio appliances

Figure 4 shows the general block diagram of the device family.

2.1 Full compatibility throughout the family

The STM32F205xx and STM32F207xx constitute the STM32F20x family whose members are fully pin-to-pin, software and feature compatible, allowing the user to try different memory densities and peripherals for a greater degree of freedom during the development cycle.

The STM32F205xx and STM32F207xx devices maintain a close compatibility with the whole STM32F10xxx family. All functional pins are pin-to-pin compatible. The STM32F205xx and STM32F207xx, however, are not drop-in replacements for the STM32F10xxx devices: the two families do not have the same power scheme, and so their power pins are different. Nonetheless, transition from the STM32F10xxx to the STM32F20x family remains simple as only a few pins are impacted.

Figure 1 compatible board design between the STM32F20x and the STM32F10xxx family.

2.2   Device overview

Figure 4.   STM32F20x block diagram
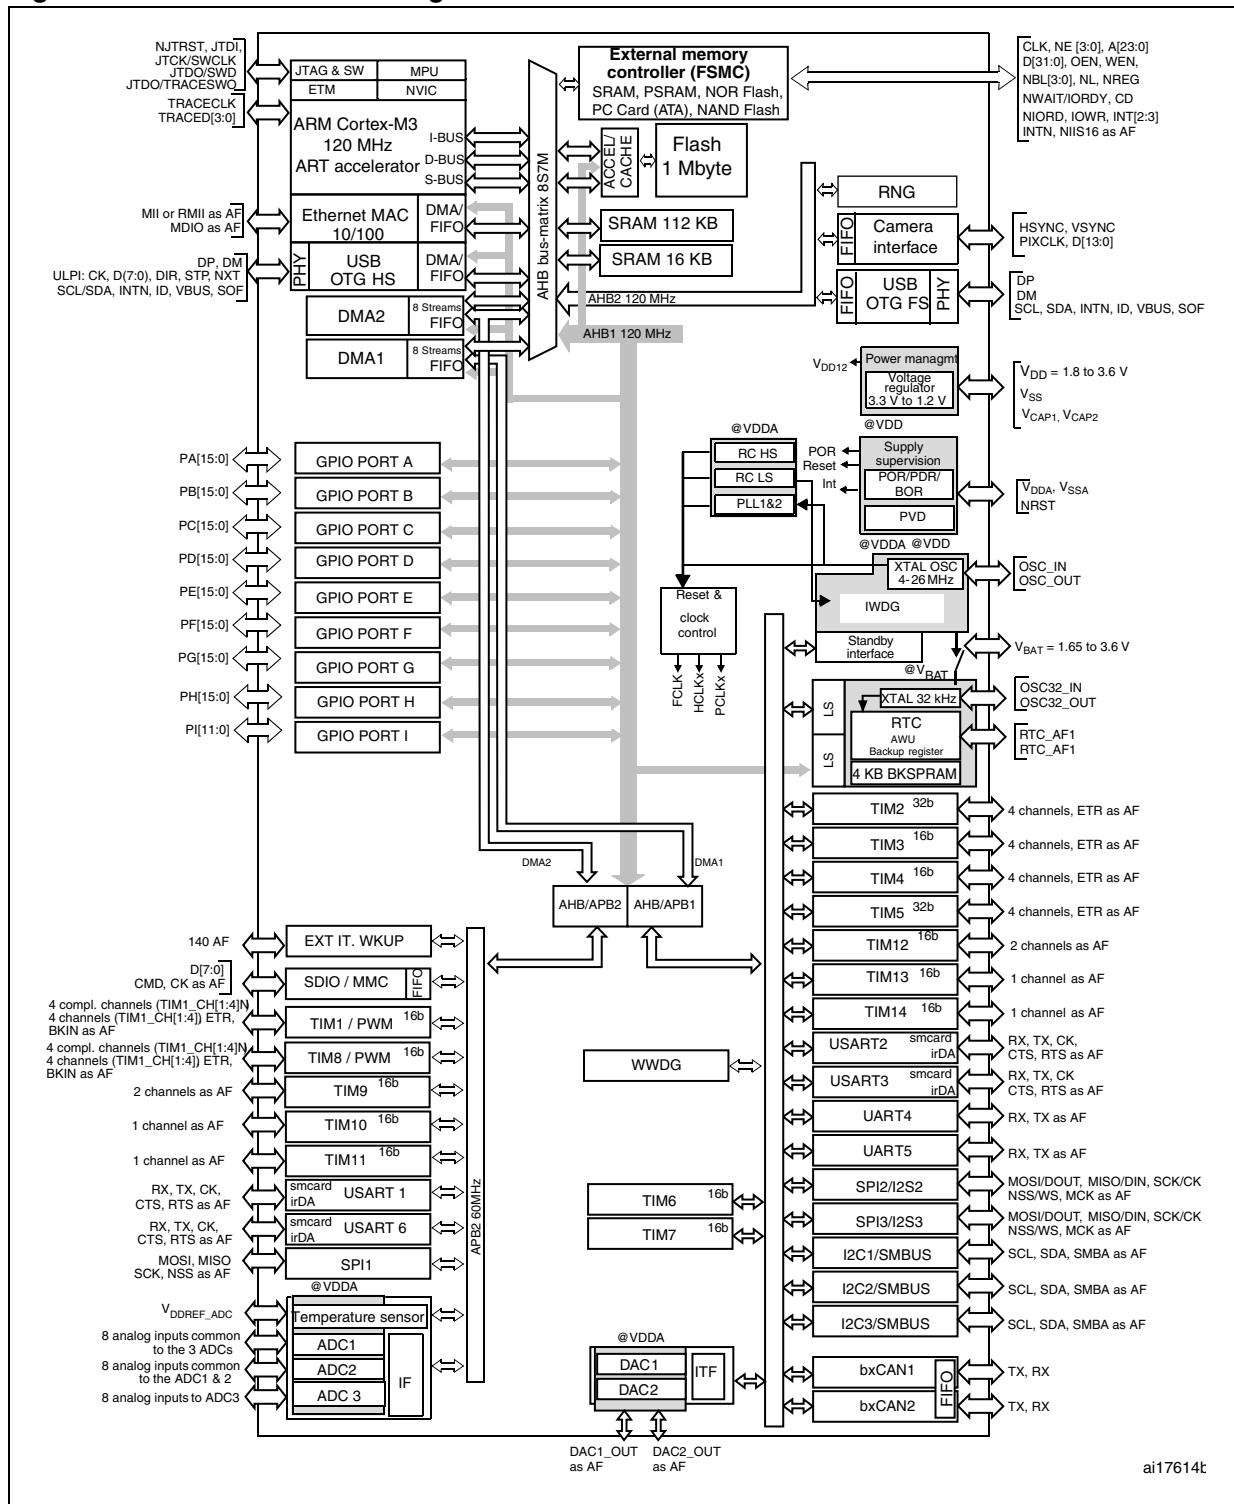

2.2.1 ARM® Cortex™-M3 core with embedded Flash and SRAM

The ARM Cortex-M3 processor is the latest generation of ARM processors for embedded systems. It was developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced response to interrupts.

The ARM Cortex-M3 32-bit RISC processor features exceptional code-efficiency, delivering the high-performance expected from an ARM core in the memory size usually associated with 8- and 16-bit devices.

With its embedded ARM core, the STM32F205xx and STM32F207xx family is compatible with all ARM tools and software.

Figure 1 shows the general block diagram of the STM32F20x family.

2.2.2 Memory protection unit

The memory protection unit (MPU) is used to separate the processing of tasks from the data protection. The MPU can manage up to 8 protection areas that can all be further divided up into 8 subareas. The protection area sizes are between 32 bytes and the whole 4 gigabytes of addressable memory.

The memory protection unit is especially helpful for applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system). If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In an RTOS environment, the kernel can dynamically update the MPU area setting, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

2.2.3 Adaptive real-time memory accelerator (ART Accelerator™)

The ART Accelerator™ is a memory accelerator which is optimized for STM32 industry-standard ARM® Cortex™-M3 processors. It balances the inherent performance advantage of the ARM Cortex-M3 over Flash memory technologies, which normally requires the processor to wait for the Flash memory at higher operating frequencies.

To release the processor full 150 DMIPS performance at this frequency, the accelerator implements an instruction prefetch queue and branch cache which increases program execution speed from the 128-bit Flash memory. Based on CoreMark benchmark, the performance achieved thanks to the ART accelerator is equivalent to 0 wait state program execution from Flash memory at a CPU frequency up to 120 MHz.

2.2.4 Embedded Flash memory

The STM32F20x devices embed a 128-bit wide Flash memory of 128 Kbytes, 256 Kbytes, 512 Kbytes, 768 Kbytes or 1 Mbytes available for storing programs and data.

2.2.5 CRC (cyclic redundancy check) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from a 32-bit data word and a fixed generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a software signature during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

2.2.6 True random number generator (RNG)

All STM32F2xxx products embed a true RNG that delivers 32-bit random numbers produced by an integrated analog circuit.

2.2.7 Embedded SRAM

All STM32F20x products embed up to 128 Kbytes of system SRAM accessed (read/write) at CPU clock speed with 0 wait states, plus 4 Kbytes of backup SRAM.

2.2.8 Multi-AHB bus matrix

The 32-bit multi-AHB bus matrix interconnects all the masters (CPU, DMAs, Ethernet, USB HS) and the slaves (Flash memory, RAM, FSMC, AHB and APB peripherals) and ensures a seamless and efficient operation even when several high-speed peripherals work simultaneously.

Figure 5.   Multi-AHB matrix
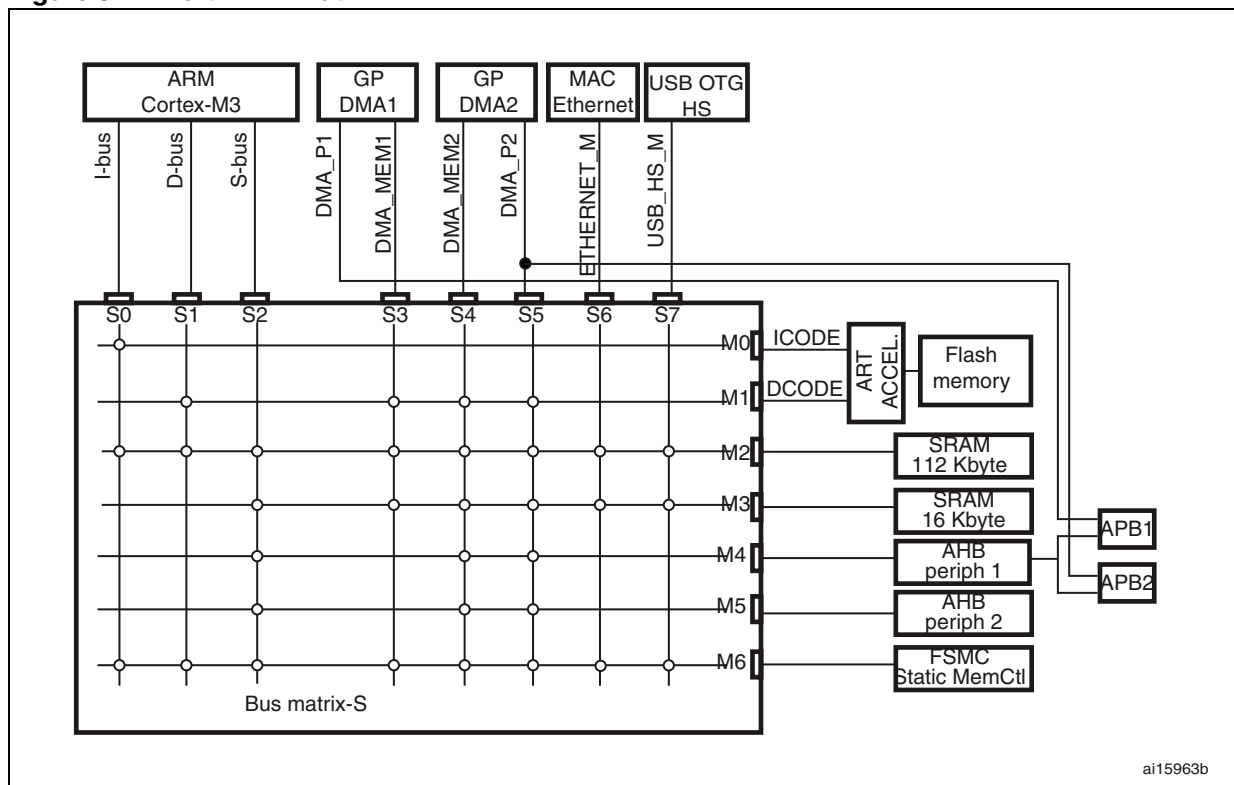

2.2.9 DMA

The flexible 16-stream general-purpose DMAs (8 streams for DMA1 and 8 streams for DMA2) are able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. They share some centralized FIFOs for APB/AHB peripherals, support burst transfer and are designed to provide the maximum peripheral bandwidth (AHB/APB) and performance.

The two DMA controllers support circular buffer management, so that no specific code is needed when the controller reaches the end of the buffer. The two DMA controllers also have a double buffering feature, which automates the use and switching of two memory buffers without requiring any special code.

Each stream is connected to dedicated hardware DMA requests, with support for software trigger on each stream. Configuration is made by software and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals:

- SPI and I^2S
- I^2C
- USART and UART
- General-purpose, basic and advanced-control timers TIMx
- DAC
- SDIO
- Camera interface (DCMI)
- ADC.

2.2.10 FSMC (flexible static memory controller)

The FSMC is embedded in the STM32F205xx and STM32F207xx family. It has four Chip Select outputs supporting the following modes: PCCard/Compact Flash, SRAM, PSRAM, NOR Flash and NAND Flash.

Functionality overview:

- Write FIFO
- Code execution from external memory except for NAND Flash and PC Card
- The targeted frequency, f_{CLK}, is equal to HCLK/2, so external access is at 60 MHz when HCLK is at 120 MHz and external access is at 30 MHz when HCLK is at 60 MHz

LCD parallel interface

The FSMC can be configured to interface seamlessly with most graphic LCD controllers. It supports the Intel 8080 and Motorola 6800 modes, and is flexible enough to adapt to specific LCD interfaces. This LCD parallel interface capability makes it easy to build cost-effective graphic applications using LCD modules with embedded controllers or high performance solutions using external controllers with dedicated acceleration.

2.2.11 Nested vectored interrupt controller (NVIC)

The STM32F205xx and STM32F207xx embed a nested vectored interrupt controller able to handle up to 87 maskable interrupt channels (not including the 16 interrupt lines of the Cortex™-M3) and 16 priority levels.

● Closely coupled NVIC gives low-latency interrupt processing

● Interrupt entry vector table address passed directly to the core

● Closely coupled NVIC core interface

● Allows early processing of interrupts

● Processing of late arriving, higher-priority interrupts

● Support tail chaining

● Processor state automatically saved

● Interrupt entry restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimum interrupt latency.

2.2.12 External interrupt/event controller (EXTI)

The external interrupt/event controller consists of 23 edge-detector lines used to generate interrupt/event requests. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the Internal APB2 clock period. Up to 140 GPIOs can be connected to the 16 external interrupt lines.

2.2.13 Clocks and startup

System clock selection is performed on startup, however, the 16 MHz internal RC oscillator is selected as the default CPU clock on reset. An external 4-26 MHz clock can be selected, in which case it is monitored for failure. If failure is detected, the system automatically switches back to the internal RC oscillator. A software interrupt is generated if enabled. Similarly, full interrupt management of the PLL clock entry is available when necessary (for example if an indirectly used external oscillator fails).

The 16 MHz internal RC oscillator is factory-trimmed to offer 1% accuracy over the full temperature range.

The advanced clock controller clocks the core and all peripherals using a single crystal or oscillator. In particular, the ethernet and USB OTG FS peripherals can be clocked by the system clock.

Several prescalers and PLLs allow the configuration of the two AHB buses, the high-speed APB (APB2) and the low-speed APB (APB1) domains. The maximum frequency of the two AHB buses is 120 MHz and the maximum frequency the high-speed APB domains is 60 MHz. The maximum allowed frequency of the low-speed APB domain is 30 MHz.

In order to achieve audio class performance, a specific crystal can be used. In this case, the I^2S master clock can generate all standard sampling frequencies from 8 kHz to 96 kHz.

2.2.14 Boot modes

At startup, boot pins are used to select one out of three boot options:

● Boot from user Flash

● boot from system memory

● Boot from embedded SRAM

The boot loader is located in system memory. It is used to reprogram the Flash memory by using USART1 (PA9/PA10), USART3 (PC10/PC11 or PB10/PB11), CAN2 (PB5/PB6), USB OTG FS in Device mode (PA9/PA11/PA12) through DFU (device firmware upgrade).

2.2.15 Power supply schemes

● V_{DD} = 1.8 to 3.6 V: external power supply for I/Os and the internal regulator (when enabled), provided externally through V_{DD} pins. On WLCSP package, V_{DD} ranges from 1.65 to 3.6 V.

● V_{SSA}, V_{DDA} = 1.8 to 3.6 V: external analog power supplies for ADC, DAC, Reset blocks, RCs and PLL. V_{DDA} and V_{SSA} must be connected to V_{DD} and V_{SS}, respectively.

● V_{BAT} = 1.65 to 3.6 V: power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when V_{DD} is not present.

2.2.16 Power supply supervisor

The device has an integrated power-on reset (POR) / power-down reset (PDR) circuitry coupled with a Brownout reset (BOR) circuitry. At power-on, BOR is always active, and ensures proper operation starting from 1.8 V. After the 1.8 V BOR threshold is reached, the option byte loading process starts, either to confirm or modify default thresholds, or to disable BOR permanently. Three BOR thresholds are available through option bytes. The device remains in reset mode when V_{DD} is below a specified threshold, $V_{POR/PDR}$ or V_{BOR}, without the need for an external reset circuit. On devices in WLCSP package, BOR can be inactivated by setting IRROFF to V_{DD} (see *Section 2.2.17: Voltage regulator*).

The device also features an embedded programmable voltage detector (PVD) that monitors the V_{DD}/V_{DDA} power supply and compares it to the V_{PVD} threshold. An interrupt can be generated when V_{DD}/V_{DDA} drops below the V_{PVD} threshold and/or when V_{DD}/V_{DDA} is higher than the V_{PVD} threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

2.2.17 Voltage regulator

The regulator has five operating modes:

● Regulator on

– Main regulator mode (MR)

– Low power regulator (LPR)

– Power-down

● Regulator off

– Regulator bypass/regulator off

– Regulator bypass/regulator off and internal reset off

Regulator on

These modes are activated by default on LQFP packages. On WLCPS66 and UFBGA176, they are activated by setting REGOFF pin to V_{SS}. V_{DD} minimum value is 1.8 V.

There are three regulator on modes:

● MR is used in the nominal regulation mode (Run)

● LPR is used in the Stop modes7

● Power-down is used in Standby mode:

   The regulator output is in high impedance: the kernel circuitry is powered down, inducing zero consumption (but the contents of the registers and SRAM are lost).

Regulator off

● Regulator bypass/regulator off

   This mode is activated by setting REGOFF pin to V_{DD}. It is available only on the UFBGA and WLCSP packages.

   The regulator bypass/regulator off mode allows to supply externally a 1.2 V voltage source through V_{CAP_1} and V_{CAP_2} pins, in addition to V_{DD}.

   V_{DD} minimum value is 1.8 V.

   The following conditions must be respected in Regulator bypass mode:

   – V_{DD} should always be higher than V_{CAP_1} and V_{CAP_2} to avoid current injection between power domains.

   – If the time for V_{CAP_1} and V_{CAP_2} to reach 1.08 V is faster than the time for V_{DD} to reach 1.8 V, then PA0 should be connected to the NRST pin (see *Figure 6*). Otherwise, PA0 should be asserted low externally until V_{DD} reaches 1.8 V (see *Figure 7*).

   In regulator bypass only mode, PA0 cannot be used as a GPIO pin.

● Regulator bypass/regulator off and internal reset off

   This mode is activated by setting IRROFF pin to V_{DD}. IRROFF cannot be activated in conjunction with REGOFF. This mode is available only on the WLCSP package. It allows to supply externally a 1.2 V voltage source through V_{CAP_1} and V_{CAP_2} pins, in addition to V_{DD}.

   V_{DD} minimum value is 1.65 V.

   The following conditions must be respected in Regulator bypass mode (see *Figure 8*):

   – V_{DD} should always be higher than V_{CAP_1} and V_{CAP_2} to avoid current injection between power domains.

   – External reset should be used to cover both conditions: until V_{CAP_1} and V_{CAP_2} reach 1.08V and until V_{DD} reaches 1.65 V

   PA0 can be used as a standard GPIO pin.

Figure 6.   Startup in regulator bypass/regulator off mode: slow V$_{DD}$ slope - power-down reset risen after V$_{CAP\_1}$/V$_{CAP\_2}$ stabilization
Figure 7.   Startup in regulator bypass/regulator off mode: slow V$_{DD}$ slope - power-down reset risen before V$_{CAP\_1}$/V$_{CAP\_2}$ stabilization
Figure 8.   Sartup in regulator bypass/regulator off and internal reset off
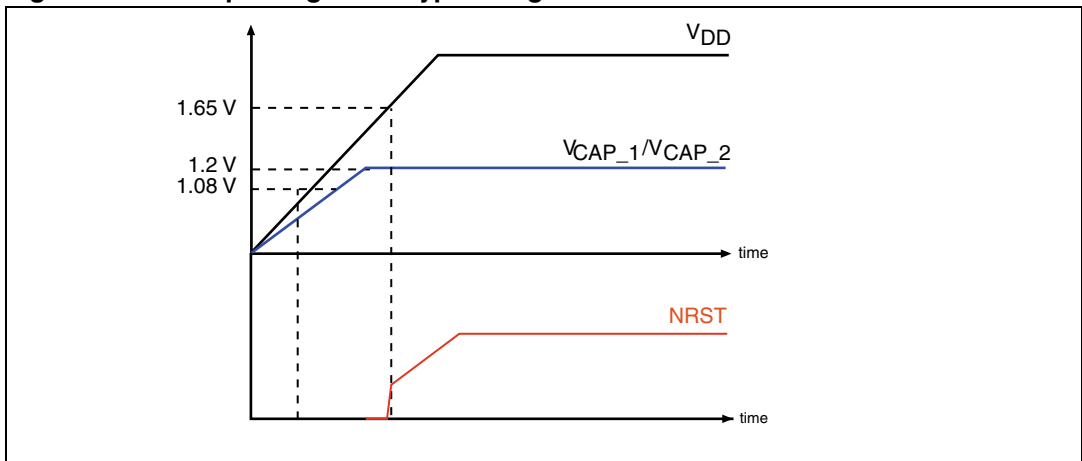

2.2.18 Real-time clock (RTC), backup SRAM and backup registers

The backup domain of the STM32F205xx and STM32F207xx includes:

● The real-time clock (RTC)
● 4 Kbytes of backup SRAM
● 20 backup registers

The RTC provides a set of continuously running counters which can be used with suitable software to provide a clock calendar function, an alarm interrupt and a periodic interrupt. It is clocked by a 32.768 kHz external crystal, resonator or oscillator, the internal low-power RC oscillator or the high-speed external clock divided by 128. The internal low-speed RC has a typical frequency of 32 kHz. The RTC can be calibrated using an external 512 Hz output to compensate for any natural quartz deviation.

The RTC features calendar registers with seconds, minutes, hours, week day, date, month, year. Two alarm registers are used to generate an alarm at a specific time and calendar fields can be independently masked for alarm comparison. To generate a periodic interrupt, a 16-bit programmable binary auto-reload downcounter with programmable resolution is available and allows automatic wakeup and periodic alarms from every 120 μs to every 36 hours.

A 20-bit prescaler is used for the time base clock. It is by default configured to generate a time base of 1 second from a clock at 32.768 kHz.

The backup SRAM size is 4 Kbytes and can be enabled by software. When the backup RAM is enabled the power consumption in Standby or V_{BAT} mode is slightly higher (see *Section 2.2.19: Low-power modes*).

The backup registers are 32-bit registers used to store 80 bytes of user application data when V_{DD} power is not present. Backup registers are not reset by a system, a power reset, or when the device wakes up from the Standby mode (see *Section 2.2.19: Low-power modes*).

The RTC, backup RAM and backup registers are supplied through a switch that takes power from either the V_{DD} supply when present or the V_{BAT} pin.

2.2.19 Low-power modes

The STM32F205xx and STM32F207xx support three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

● **Sleep mode**

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

● **Stop mode**

The Stop mode achieves the lowest power consumption while retaining the contents of SRAM and registers. All clocks in the 1.2 V domain are stopped, the PLL, the HSI RC

and the HSE crystal oscillators are disabled. The voltage regulator can also be put either in normal or in low-power mode.

The device can be woken up from the Stop mode by any of the EXTI line. The EXTI line source can be one of the 16 external lines, the PVD output, the RTC alarm / wakeup / tamper / time stamp events, the USB OTG FS/HS wakeup or the Ethernet wakeup.

● **Standby mode**

The Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire 1.2 V domain is powered off. The PLL, the HSI RC and the HSE crystal oscillators are also switched off. After entering Standby mode, the SRAM and register contents are lost except for registers in the backup domain and the backup SRAM when selected.

The device exits the Standby mode when an external reset (NRST pin), an IWDG reset, a rising edge on the WKUP pin, or an RTC alarm / wakeup / tamper /time stamp event occurs.

Note: *1*   *The RTC, the IWDG, and the corresponding clock sources are not stopped when the device enters the Stop or Standby mode.*

2.2.20 V_{BAT} operation

The V_{BAT} pin allows to power the device V_{BAT} domain from an external battery or an external supercapacitor.

V_{BAT} operation is activated when V_{DD} is not present.

Note: *When the microcontroller is supplied from V_{BAT}, external interrupts and RTC alarm/events do not exit it from V_{BAT} operation.*

2.2.21 Timers and watchdogs

The STM32F205xx and STM32F207xx devices include two advanced-control timers, eight general-purpose timers, two basic timers and two watchdog timers.

Table 3 compares the features of the advanced-control, general-purpose and basic timers.

Table 3.   **Timer feature comparison**

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/ compare channels	Complementary output	Max interface clock	Max timer clock
Advanced-control	TIM1, TIM8	16-bit	Up, Down, Up/down	Any integer between 1 and 65536	Yes	4	Yes	60 MHz	120 MHz
General purpose	TIM2, TIM5	32-bit	Up, Down, Up/down	Any integer between 1 and 65536	Yes	4	No	30 MHz	60 MHz
	TIM3, TIM4	16-bit	Up, Down, Up/down	Any integer between 1 and 65536	Yes	4	No	30 MHz	60 MHz
Basic	TIM6, TIM7	16-bit	Up	Any integer between 1 and 65536	Yes	0	No	30 MHz	60 MHz

Table 3.   Timer feature comparison (continued)

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/ compare channels	Complementary output	Max interface clock	Max timer clock
General purpose	TIM9	16-bit	Up	Any integer between 1 and 65536	No	2	No	60 MHz	120 MHz
	TIM10, TIM11	16-bit	Up	Any integer between 1 and 65536	No	1	No	60 MHz	120 MHz
	TIM12	16-bit	Up	Any integer between 1 and 65536	No	2	No	30 MHz	60 MHz
	TIM13, TIM14	16-bit	Up	Any integer between 1 and 65536	No	1	No	30 MHz	60 MHz

Advanced-control timers (TIM1, TIM8)

The advanced-control timers (TIM1, TIM8) can be seen as three-phase PWM generators multiplexed on 6 channels. They have complementary PWM outputs with programmable inserted dead times. They can also be considered as complete general-purpose timers. Their 4 independent channels can be used for:

● Input capture

● Output compare

● PWM generation (edge- or center-aligned modes)

● One-pulse mode output

If configured as standard 16-bit timers, they have the same features as the general-purpose TIMx timers. If configured as 16-bit PWM generators, they have full modulation capability (0-100%).

The TIM1 and TIM8 counters can be frozen in debug mode. Many of the advanced-control timer features are shared with those of the standard TIMx timers which have the same architecture. The advanced-control timer can therefore work together with the TIMx timers via the Timer Link feature for synchronization or event chaining.

General-purpose timers (TIMx)

There are ten synchronizable general-purpose timers embedded in the STM32F20x devices (see *Table 3* for differences).

● **TIM2, TIM3, TIM4, TIM5**

The STM32F20x include 4 full-featured general-purpose timers. TIM2 and TIM5 are 32-bit timers, and TIM3 and TIM4 are 16-bit timers. The TIM2 and TIM5 timers are based on a 32-bit auto-reload up/downcounter and a 32-bit prescaler. The TIM3 and TIM4 timers are based on a 16-bit auto-reload up/downcounter and a 16-bit prescaler. They all feature 4 independent channels for input capture/output compare, PWM or one-pulse mode output. This gives up to 16 input capture/output compare/PWMs on the largest packages.

The TIM2, TIM3, TIM4, TIM5 general-purpose timers can work together, or with the other general-purpose timers and the advanced-control timers TIM1 and TIM8 via the Timer Link feature for synchronization or event chaining.

The counters of TIM2, TIM3, TIM4, TIM5 can be frozen in debug mode. Any of these general-purpose timers can be used to generate PWM outputs.

TIM2, TIM3, TIM4, TIM5 all have independent DMA request generation. They are capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 4 hall-effect sensors.

● **TIM10, TIM11 and TIM9**

These timers are based on a 16-bit auto-reload upcounter and a 16-bit prescaler. TIM10 and TIM11 feature one independent channel, whereas TIM9 has two independent channels for input capture/output compare, PWM or one-pulse mode output. They can be synchronized with the TIM2, TIM3, TIM4, TIM5 full-featured general-purpose timers. They can also be used as simple time bases.

● **TIM12, TIM13 and TIM14**

These timers are based on a 16-bit auto-reload upcounter and a 16-bit prescaler. TIM13 and TIM14 feature one independent channel, whereas TIM12 has two independent channels for input capture/output compare, PWM or one-pulse mode output. They can be synchronized with the TIM2, TIM3, TIM4, TIM5 full-featured general-purpose timers.

They can also be used as simple time bases.

2.2.22 Basic timers TIM6 and TIM7

These timers are mainly used for DAC trigger and waveform generation. They can also be used as a generic 16-bit time base.

2.2.23 Independent watchdog

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 32 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management. It is hardware- or software-configurable through the option bytes.
The counter can be frozen in debug mode.

2.2.24 Window watchdog

The window watchdog is based on a 7-bit downcounter that can be set as free-running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

2.2.25   SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard downcounter. It features:

● A 24-bit downcounter
● Autoreload capability
● Maskable system interrupt generation when the counter reaches 0
● Programmable clock source

2.2.26   I²C bus

Up to three I²C bus interfaces can operate in multimaster and slave modes. They can support the Standard- and Fast-modes. They support the 7/10-bit addressing mode and the 7-bit dual addressing mode (as slave). A hardware CRC generation/verification is embedded.

They can be served by DMA and they support SMBus 2.0/PMBus.

2.2.27   Universal synchronous/asynchronous receiver transmitters (UARTs/USARTs)

The STM32F205xx and STM32F207xx embed four universal synchronous/asynchronous receiver transmitters (USART1, USART2, USART3 and USART6) and two universal asynchronous receiver transmitters (UART4 and UART5).

These six interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode and have LIN Master/Slave capability. The USART1 and USART6 interfaces are able to communicate at speeds of up to 7.5 Mbit/s. The other available interfaces communicate at up to 3.75 Mbit/s.

USART1, USART2, USART3 and USART6 also provide hardware management of the CTS and RTS signals, Smart Card mode (ISO 7816 compliant) and SPI-like communication capability. All interfaces can be served by the DMA controller.

Table 4.   USART feature comparison

USART name	Standard features	Modem (RTS/CTS)	LIN	SPI master	irDA	Smartcard (ISO 7816)	Max. baud rate in Mbit/s (oversampling by 16)	Max. baud rate in Mbit/s (oversampling by 8)	APB mapping
USART1	X	X	X	X	X	X	3.75	7.5	APB2 (max. 60 MHz)
USART2	X	X	X	X	X	X	1.87	3.75	APB1 (max. 30 MHz)
USART3	X	X	X	X	X	X	1.87	3.75	APB1 (max. 30 MHz)

Table 4. USART feature comparison (continued)

USART name	Standard features	Modem (RTS/CTS)	LIN	SPI master	irDA	Smartcard (ISO 7816)	Max. baud rate in Mbit/s (oversampling by 16)	Max. baud rate in Mbit/s (oversampling by 8)	APB mapping
UART4	X	-	X	-	X	-	1.87	3.75	APB1 (max. 30 MHz)
UART5	X	-	XD	-	X	-	3.75	3.75	APB1 (max. 30 MHz)
USART6	X	X	X	X	X	X	3.75	7.5	APB2 (max. 60 MHz)

2.2.28 Serial peripheral interface (SPI)

The STM32F20x feature up to three SPIs in slave and master modes in full-duplex and simplex communication modes. SPI1 can communicate at up to 30 Mbits/s, SPI2 and SPI3 can communicate at up to 15 Mbit/s. The 3-bit prescaler gives 8 master mode frequencies and the frame is configurable to 8 bits or 16 bits. The hardware CRC generation/verification supports basic SD Card/MMC modes. All SPIs can be served by the DMA controller.

The SPI interface can be configured to operate in TI mode for communications in master mode and slave mode.

2.2.29 Inter-integrated sound (I^2S)

Two standard I^2S interfaces (multiplexed with SPI2 and SPI3) are available. They can be operated in master or slave mode, and can be configured to operate with a 16-/32-bit resolution as input or output channels. Audio sampling frequencies from 8 kHz up to 96 kHz are supported. When either or both of the I^2S interfaces is/are configured in master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency.

2.2.30 SDIO

An SD/SDIO/MMC host interface is available, that supports MultiMediaCard System Specification Version 4.2 in three different databus modes: 1-bit (default), 4-bit and 8-bit.

The interface allows data transfer at up to 48 MHz in 8-bit mode, and is compliant with the SD Memory Card Specification Version 2.0.

The SDIO Card Specification Version 2.0 is also supported with two different databus modes: 1-bit (default) and 4-bit.

The current version supports only one SD/SDIO/MMC4.2 card at any one time and a stack of MMC4.1 or previous.

In addition to SD/SDIO/MMC, this interface is fully compliant with the CE-ATA digital protocol Rev1.1.

2.2.31   Ethernet MAC interface with dedicated DMA and IEEE 1588 support

Peripheral available only on the STM32F207xx devices.

The STM32F207xx devices provide an IEEE-802.3-2002-compliant media access controller (MAC) for ethernet LAN communications through an industry-standard medium-independent interface (MII) or a reduced medium-independent interface (RMII). The STM32F207xx requires an external physical interface device (PHY) to connect to the physical LAN bus (twisted-pair, fiber, etc.). the PHY is connected to the STM32F207xx MII port using 17 signals for MII or 9 signals for RMII, and can be clocked using the 25 MHz (MII) or 50 MHz (RMII) output from the STM32F207xx.

The STM32F207xx includes the following features:

● Supports 10 and 100 Mbit/s rates
● Dedicated DMA controller allowing high-speed transfers between the dedicated SRAM and the descriptors (see the STM32F20x and STM32F21x reference manual for details)
● Tagged MAC frame support (VLAN support)
● Half-duplex (CSMA/CD) and full-duplex operation
● MAC control sublayer (control frames) support
● 32-bit CRC generation and removal
● Several address filtering modes for physical and multicast address (multicast and group addresses)
● 32-bit status code for each transmitted or received frame
● Internal FIFOs to buffer transmit and receive frames. The transmit FIFO and the receive FIFO are both 2 Kbytes, that is 4 Kbytes in total
● Supports hardware PTP (precision time protocol) in accordance with IEEE 1588 2008 (PTP V2) with the time stamp comparator connected to the TIM2 input
● Triggers interrupt when system time becomes greater than target time

2.2.32   Controller area network (CAN)

The two CANs are compliant with the 2.0A and B (active) specifications with a bitrate up to 1 Mbit/s. They can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. Each CAN has three transmit mailboxes, two receive FIFOS with 3 stages and 28 shared scalable filter banks (all of them can be used even if one CAN is used). The 256 bytes of SRAM which are allocated for each CAN are not shared with any other peripheral.

2.2.33   Universal serial bus on-the-go full-speed (OTG_FS)

The STM32F205xx and STM32F207xx embed an USB OTG full-speed device/host/OTG peripheral with integrated transceivers. The USB OTG FS peripheral is compliant with the USB 2.0 specification and with the OTG 1.0 specification. It has software-configurable endpoint setting and supports suspend/resume. The USB OTG full-speed controller

requires a dedicated 48 MHz clock that is generated by a PLL connected to the HSE oscillator. The major features are:

● Combined Rx and Tx FIFO size of 320 × 35 bits with dynamic FIFO sizing

● Supports the session request protocol (SRP) and host negotiation protocol (HNP)

● 4 bidirectional endpoints

● 8 host channels with periodic OUT support

● HNP/SNP/IP inside (no need for any external resistor)

● For OTG/Host modes, a power switch is needed in case bus-powered devices are connected

● Internal FS OTG PHY support

● External FS OTG PHY support through an I^2C connection

2.2.34 Universal serial bus on-the-go high-speed (OTG_HS)

The STM32F205xx and STM32F207xx devices embed a USB OTG high-speed (up to 480 Mb/s) device/host/OTG peripheral. The USB OTG HS supports both full-speed and high-speed operations. It integrates the transceivers for full-speed operation (12 MB/s) and features a UTMI low-pin interface (ULPI) for high-speed operation (480 MB/s). When using the USB OTG HS in HS mode, an external PHY device connected to the ULPI is required.

The USB OTG HS peripheral is compliant with the USB 2.0 specification and with the OTG 1.0 specification. It has software-configurable endpoint setting and supports suspend/resume. The USB OTG full-speed controller requires a dedicated 48 MHz clock that is generated by a PLL connected to the HSE oscillator. The major features are:

● Combined Rx and Tx FIFO size of 1 Kbit × 35 with dynamic FIFO sizing

● Supports the session request protocol (SRP) and host negotiation protocol (HNP)

● 6 bidirectional endpoints

● 12 host channels with periodic OUT support

● Internal FS OTG PHY support

● External FS OTG PHY support through an I^2C connection

● External HS or HS OTG operation supporting ULPI in SDR mode. The OTG PHY is connected to the microcontroller ULPI port through 12 signals. It can be clocked using the 60 MHz output.

● Internal USB DMA

● HNP/SNP/IP inside (no need for any external resistor)

● for OTG/Host modes, a power switch is needed in case bus-powered devices are connected

2.2.35 Audio PLL (PLLI2S)

The devices feature an additional dedicated PLL for audio I^2S application. It allows to achieve error-free I^2S sampling clock accuracy without compromising on the CPU performance, while using USB peripherals.

The PLLI2S configuration can be modified to manage an I^2S sample rate change without disabling the main PLL (PLL) used for CPU, USB and Ethernet interfaces.

The audio PLL can be programmed with very low error to obtain sampling rates ranging from 8 KHz to 96 KHz.

In addition to the audio PLL, a master clock input pin can be used to synchronize the I2S flow with an external PLL (or Codec output).

2.2.36 Digital camera interface (DCMI)

The camera interface is *not* available in STM32F205xx devices.

STM32F207xx products embed a camera interface that can connect with camera modules and CMOS sensors through an 8-bit to 14-bit parallel interface, to receive video data. The camera interface can sustain up to 27 Mbyte/s at 27 MHz or 48 Mbyte/s at 48 MHz. It features:

● Programmable polarity for the input pixel clock and synchronization signals
● Parallel data communication can be 8-, 10-, 12- or 14-bit
● Supports 8-bit progressive video monochrome or raw bayer format, YCbCr 4:2:2 progressive video, RGB 565 progressive video or compressed data (like JPEG)
● Supports continuous mode or snapshot (a single frame) mode
● Capability to automatically crop the image

2.2.37 GPIOs (general-purpose inputs/outputs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain, with or without pull-up or pull-down), as input (floating, with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high-current-capable and have speed selection to better manage internal noise, power consumption and electromagnetic emission.

The I/O alternate function configuration can be locked if needed by following a specific sequence in order to avoid spurious writing to the I/Os registers.

To provide fast I/O handling, the GPIOs are on the fast AHB1 bus with a clock up to 120 MHz that leads to a maximum I/O toggling speed of 60 MHz.

2.2.38 ADCs (analog-to-digital converters)

Three 12-bit analog-to-digital converters are embedded and each ADC shares up to 16 external channels, performing conversions in the single-shot or scan mode. In scan mode, automatic conversion is performed on a selected group of analog inputs.

Additional logic functions embedded in the ADC interface allow:

● Simultaneous sample and hold
● Interleaved sample and hold

The ADC can be served by the DMA controller. An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the timers TIM1, TIM2, TIM3, TIM4, TIM5 and TIM8 can be internally connected to the ADC start trigger and injection trigger, respectively, to allow the application to synchronize A/D conversion and timers.

2.2.39 DAC (digital-to-analog converter)

The two 12-bit buffered DAC channels can be used to convert two digital signals into two analog voltage signal outputs. The design structure is composed of integrated resistor strings and an amplifier in inverting configuration.

This dual digital Interface supports the following features:

● two DAC converters: one for each output channel
● 8-bit or 12-bit monotonic output
● left or right data alignment in 12-bit mode
● synchronized update capability
● noise-wave generation
● triangular-wave generation
● dual DAC channel independent or simultaneous conversions
● DMA capability for each channel
● external triggers for conversion
● input voltage reference V_{REF+}

Eight DAC trigger inputs are used in the device. The DAC channels are triggered through the timer update outputs that are also connected to different DMA streams.

2.2.40 Temperature sensor

The temperature sensor has to generate a voltage that varies linearly with temperature. The conversion range is between 1.8 V and 3.6 V. The temperature sensor is internally connected to the ADC1_IN16 input channel which is used to convert the sensor output voltage into a digital value.

As the offset of the temperature sensor varies from chip to chip due to process variation, the internal temperature sensor is mainly suitable for applications that detect temperature changes instead of absolute temperatures. If an accurate temperature reading is needed, then an external temperature sensor part should be used.

2.2.41 Serial wire JTAG debug port (SWJ-DP)

The ARM SWJ-DP interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target. The JTAG TMS and TCK pins are shared with SWDIO and SWCLK, respectively, and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

2.2.42 Embedded Trace Macrocell™

The ARM Embedded Trace Macrocell provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32F20x through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. The TPA is connected to a host computer using USB, Ethernet, or any other high-speed channel. Real-time instruction and data flow activity can be recorded and then formatted for display on the host computer that runs the debugger software. TPA hardware is commercially available from common development tool vendors.

The Embedded Trace Macrocell operates with third party debugger software tools.

1. I = input, O = output, S = supply, HiZ = high impedance.

2. FT = 5 V tolerant.

3. Function availability depends on the chosen device.

4. PC13, PC14, PC15 and PI8 are supplied through the power switch. Since the switch only sinks a limited amount of current (3 mA), the use of GPIOs PC13 to PC15 and PI8 in output mode is limited: the speed should not exceed 2 MHz with a maximum load of 30 pF and these I/Os must not be used as a current source (e.g. to drive an LED).

5. Main function after the first backup domain power-up. Later on, it depends on the contents of the RTC registers even after reset (because these registers are not reset by the main reset). For details on how to manage these I/Os, refer to the RTC register description sections in the STM32F20x and STM32F21x reference manual, available from the STMicroelectronics website: www.st.com.

6. FT = 5 V tolerant except when in analog mode or oscillator mode (for PC14, PC15, PH0 and PH1).

7. If the device is delivered in an UFBGA176 package and if the REGOFF pin is set to V_{DD} (Regulator in bypass mode), then PA0 is used as an internal Reset (active low).

8. FSMC_NL pin is also named FSMC_NADV on memory devices.

9. RFU = reserved for future use.

4 Memory mapping

The memory map is shown in *Figure 15*.

Figure 15. Memory map
5   Electrical characteristics

5.1   Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS}.

5.1.1   Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25$ °C and $T_A = T_A$max (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean$\pm3\Sigma$).

5.1.2   Typical values

Unless otherwise specified, typical data are based on $T_A = 25$ °C, $V_{DD} = 3.3$ V (for the 1.8 V $\leq V_{DD} \leq 3.6$ V voltage range). They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean$\pm2\Sigma$).

5.1.3   Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

5.1.4   Loading capacitor

The loading conditions used for pin parameter measurement are shown in *Figure 16*.

5.1.5   Pin input voltage

The input voltage measurement on a pin of the device is described in *Figure 17*.

Figure 16. Pin loading conditions	Figure 17. Pin input voltage
5.1.6 Power supply scheme

Figure 18.   Power supply scheme
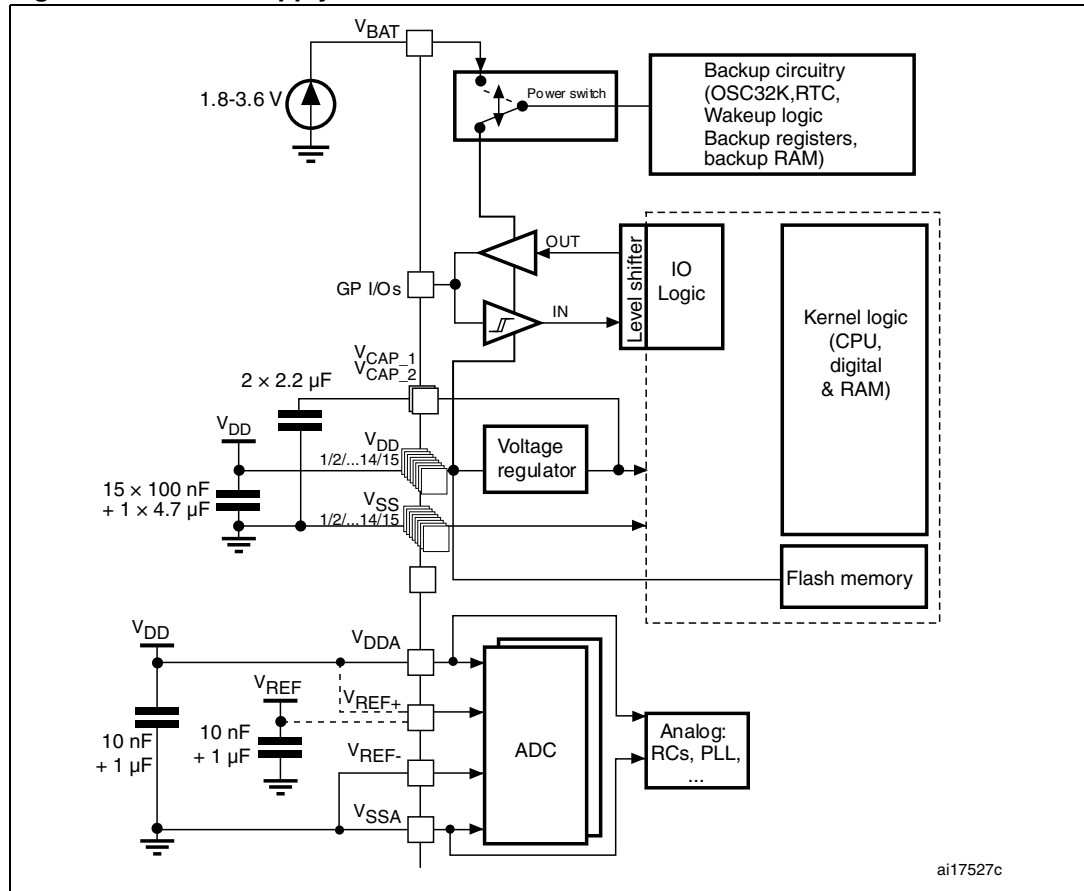

1.   4.7µF capacitor must be connected to one of the V_{DD} pin.

5.1.7 Current consumption measurement

Figure 19.   Current consumption measurement scheme
5.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in *Table 7: Voltage characteristics*, *Table 8: Current characteristics*, and *Table 9: Thermal characteristics* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 7.   Voltage characteristics

Symbol	Ratings	Min	Max	Unit
$V_{DD}–V_{SS}$	External main supply voltage (including V_{DDA}, V_{DD})[1]	TBD	TBD	V
V_{IN}	Input voltage on five-volt tolerant pin[2]	$V_{SS}–0.3$	$V_{DD}+4.0$	
	Input voltage on any other pin[3]	$V_{SS}–0.3$	4.0	
$|\Delta V_{DDx}|$	Variations between different V_{DD} power pins		TBD	mV
$|V_{SSX} – V_{SS}|$	Variations between all the different ground pins		TBD	
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	see *Section 5.3.13: Absolute maximum ratings (electrical sensitivity)*		

1. All main power (V_{DD}, V_{DDA}) and ground (V_{SS}, V_{SSA}) pins must always be connected to the external power supply, in the permitted range.

2. $I_{INJ(PIN)}$ must never be exceeded (see *Table 8: Current characteristics*). This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{IN}$max while a negative injection is induced by $V_{IN} < V_{SS}$.

3. Positive current injection is not possible on these I/Os. VIN maximum must be respected. Negative current injection is possible and must not exceed $I_{INJ(PIN)}$.

Table 8.   Current characteristics

Symbol	Ratings	Max.	Unit
I_{VDD}	Total current into V_{DD}/V_{DDA} power lines (source)[1]	TBD	mA
I_{VSS}	Total current out of V_{SS} ground lines (sink)[1]	TBD	
I_{IO}	Output current sunk by any I/O and control pin	TBD	
	Output current source by any I/Os and control pin	TBD	
$I_{INJ(PIN)}$ [2]	Injected current on five-volt tolerant I/O[3]	−5/+0	
	Injected current on any other pin[4]	±5	
$\Sigma I_{INJ(PIN)}$[4]	Total injected current (sum of all I/O and control pins)[5]	TBD	

1. All main power (V_{DD}, V_{DDA}) and ground (V_{SS}, V_{SSA}) pins must always be connected to the external power supply, in the permitted range.

2. Negative injection disturbs the analog performance of the device. See note in *Section 5.3.18: 12-bit ADC characteristics*.

3. Positive injection is not possible on these I/Os. V_{IN} maximum must always be respected. $I_{INJ(PIN)}$ must never be exceeded. A negative injection is induced by $V_{IN}<V_{SS}$.

4. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$.

5.   When several inputs are submitted to a current injection, the maximum $\Sigma I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with $\Sigma I_{INJ(PIN)}$ maximum current injection on four I/O port pins of the device.

Table 9.   Thermal characteristics

Symbol	Ratings	Value	Unit
T_{STG}	Storage temperature range	–40 to +125	°C
T_J	Maximum junction temperature	125	°C

5.3   Operating conditions

5.3.1   General operating conditions

Table 10.   General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
f_{HCLK}	Internal AHB clock frequency		0	120	MHz
f_{PCLK1}	Internal APB1 clock frequency		0	30	
f_{PCLK2}	Internal APB2 clock frequency		0	60	
V_{DD}	Standard operating voltage		1.8[1]	3.6	V
V_{DDA}[2]	Analog operating voltage (ADC limited to 1 M samples)	Must be the same potential as V_{DD}[3]	1.8[1]	3.6	V
	Analog operating voltage (ADC limited to 2 M samples)		2.4	3.6	
V_{BAT}	Backup operating voltage		1.65	3.6	V
P_D	Power dissipation at T_A = 85 °C for suffix 6 or T_A = 105 °C for suffix 7[4]	LQFP64		444	mW
		WLCSP66		392	
		LQFP100		434	
		LQFP144		500	
		LQFP176		526	
		UFBGA176		513	
T_A	Ambient temperature for 6 suffix version	Maximum power dissipation	–40	85	°C
		Low power dissipation[5]	–40	105	
	Ambient temperature for 7 suffix version	Maximum power dissipation	–40	105	°C
		Low power dissipation[5]	–40	125	
T_J	Junction temperature range	6 suffix version	–40	105	°C
		7 suffix version	–40	125	

1.   This value is reduced to 1.65 V for STM32F20x in WLCSP package assuming IRROFF is set to V_{DD}.

2.   When the ADC is used, refer to *Table 59: ADC characteristics*.

3.   It is recommended to power V_{DD} and V_{DDA} from the same source. A maximum difference of 300 mV between V_{DD} and V_{DDA} can be tolerated during power-up and operation.

4. If T_A is lower, higher P_D values are allowed as long as T_J does not exceed $T_J$max.

5. In low power dissipation state, T_A can be extended to this range as long as T_J does not exceed $T_J$max.

Table 11.   Limitations depending on the operating power supply range

Operating power supply range	ADC operation	Maximum Flash memory access frequency ($f_{Flashmax}$)	Number of wait states at maximum CPU frequency (f_{CPUmax}= 120 MHz)[1]	I/O operation	FSMC controller operation	Possible Flash memory operations
V_{DD} =1.8 to 2.1 V[2]	Conversion time up to 1 Msps	16 MHz with no Flash memory wait state	7[3]	– Degraded speed performance – No I/O compensation	up to 30 MHz	8-bit erase and program operations only
V_{DD} = 2.1 to 2.4 V	Conversion time up to 1 Msps	18 MHz with no Flash memory wait state	6[3]	– Degraded speed performance – No I/O compensation	up to 30 MHz	16-bit erase and program operations
V_{DD} = 2.4 to 2.7 V	Conversion time up to 2 Msps	24 MHz with no Flash memory wait state	4[3]	– Degraded speed performance – I/O compensation works	up to 48 MHz	16-bit erase and program operations
V_{DD} = 2.7 to 3.6 V[4]	Conversion time up to 2 Msps	30 MHz with no Flash memory wait state	3[3]	– Full-speed operation – I/O compensation works	– up to 60 MHz when V_{DD} = 3.0 to 3.6 V – up to 48 MHz when V_{DD} = 2.7 to 3.0 V	32-bit erase and program operations

1. The number of wait states can be reduced by reducing the CPU frequency (see *Figure 20*).

2. This voltage range is reduced to 1.65 to 2.1 V for devices in WLCSP package assuming IRROFF is set to V_{DD}.

3. Thanks to the ART accelerator and the 128-bit Flash memory, the number of wait states given here does not impact the execution speed from Flash memory since the ART accelerator allows to achieve a performance equivalent to 0 wait state program execution.

4. The voltage range for ULPI USB high-speed, Ethernet MII and Ethernet RMII is 3.0 to 3.6 V.

Figure 20.   Number of wait states versus f_{CPU} and V_{DD} range
5.3.2   Operating conditions at power-up / power-down (regulator not bypassed)

Subject to general operating conditions for T_A.

Table 12.   Operating conditions at power-up / power-down (regulator not bypassed)

Symbol	Parameter	Min	Max	Unit
t_{VDD}	V_{DD} rise time rate	TBD	∞	μs/V
	V_{DD} fall time rate	TBD	∞	

5.3.3 Operating conditions at power-up / power-down in regulator bypass mode

Subject to general operating conditions for T_A.

Table 13.   Operating conditions at power-up / power-down in regulator bypass mode

Symbol	Parameter	Conditions	Min	Max	Unit
t_{VDD}	V_{DD} rise time rate	Power-up	TBD	∞	μs/V
	V_{DD} fall time rate	Power-down	TBD	∞	
t_{VCAP}	V_{CAP_1} and V_{CAP_2} rise time rate	Power-up	TBD	∞	
	V_{CAP_1} and V_{CAP_2} fall time rate	Power-down	TBD	∞	

5.3.4 Embedded reset and power control block characteristics

The parameters given in *Table 14* are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 10*.

Table 14.   Embedded reset and power control block characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{PVD}	Programmable voltage detector level selection	PLS[2:0]=000 (rising edge)	TBD	TBD	TBD	V

I_{RUSH}	InRush current on voltage regulator power-on		-	-	200	mA

1. The product behavior is guaranteed by design down to the minimum $V_{POR/PDR}$ value.

2. Guaranteed by design, not tested in production.

5.3.5 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.
The current consumption is measured as described in *Figure 19: Current consumption measurement scheme*.
All run mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to Dhrystone 2.1 code.

Typical and maximum current consumption

The MCU is placed under the following conditions:

● All I/O pins are in input mode with a static value at V_{DD} or V_{SS} (no load).

● All peripherals are disabled except if it is explicitly mentioned.

● The Flash access time is adjusted to f_{HCLK} frequency (0 wait state from 0 to 30 MHz, 1 wait state from 30 to 60 MHz, 2 wait states from 60 to 90 MHz and 3 wait states from 90 to 120 MHz).

● Prefetch and Cache ON (Reminder: this bit must be set before clock setting and bus prescaling).

● When the peripherals are enabled $f_{PCLK1} = f_{HCLK}/4$, $f_{PCLK}2 = f_{HCLK}/2$, $f_{ADCCLK} = f_{PCLK2}/4$

● The maximum values are obtained for $V_{DD} = 3.6$ V and maximum ambient temperature (T_A), and the typical values for $T_A = 25$ °C and $V_{DD} = 3.3$ V unless otherwise specified.

Table 15.   Typical and maximum current consumption in Run mode, code with data processing running from Flash

Symbol	Parameter	Conditions	f_{HCLK}	Typical	Max[1]		Unit
				$T_A = 25$ °C	$T_A = 85$ °C	$T_A = 105$ °C	
I_{DD}	Supply current in Run mode	External clock[2], all peripherals enabled	120 MHz	TBD	TBD	TBD	mA
			90 MHz	TBD	TBD	TBD	
			60 MHz	TBD	TBD	TBD	
			30 MHz	TBD	TBD	TBD	
			26 MHz	TBD	TBD	TBD	
			16 MHz	TBD	TBD	TBD	
		External clock[2], all peripherals disabled	120 MHz	TBD	TBD	TBD	
			90 MHz	TBD	TBD	TBD	
			60 MHz	TBD	TBD	TBD	
			30 MHz	TBD	TBD	TBD	
			26 MHz	TBD	TBD	TBD	
			16 MHz	TBD	TBD	TBD	

1. Based on characterization, not tested in production.

2. External clock is 8 MHz and PLL is on when $f_{HCLK} > 8$ MHz.

Table 16.   Typical and maximum current consumption in Run mode, code with data processing running from RAM

Symbol	Parameter	Conditions	f_{HCLK}	Typ	Max[1]		Unit
				T_A = 25 °C	T_A = 85 °C	T_A = 105 °C	
I_{DD}	Supply current in Run mode	External clock[2], all peripherals enabled[3]	120 MHz	49.5	TBD	TBD	mA
			90 MHz	38	TBD	TBD	
			60 MHz	26	TBD	TBD	
			30 MHz	14.5	TBD	TBD	
			26 MHz	TBD	TBD	TBD	
			16 MHz	TBD	TBD	TBD	
		External clock[2], all peripherals disabled	120 MHz	22	TBD	TBD	
			90 MHz	17	TBD	TBD	
			60 MHz	12.5	TBD	TBD	
			30 MHz	7	TBD	TBD	
			26 MHz	TBD	TBD	TBD	
			16 MHz	TBD	TBD	TBD	

1. Based on characterization, tested in production at V_{DD} max, f_{HCLK} max.

2. External clock is 8 MHz and PLL is on when f_{HCLK} > 8 MHz.

3. Add an additional power consumption of 0.8 mA per ADC for the analog part. In applications, this consumption occurs only while the ADC is on (ADON bit is set in the ADC_CR2 register).

Table 17.   Typical and maximum current consumption in Sleep mode

Symbol	Parameter	Conditions	f_{HCLK}	Typ	Max[1]		Unit
				T_A = 25 °C	T_A = 85 °C	T_A = 105 °C	
I_{DD}	Supply current in Sleep mode	External clock[2], all peripherals enabled[3]	120 MHz	37.5	TBD	TBD	mA
			90 MHz	29.5	TBD	TBD	
			60 MHz	20.5	TBD	TBD	
			30 MHz	14.5	TBD	TBD	
			26 MHz	TBD	TBD	TBD	
			16 MHz	TBD	TBD	TBD	
		External clock[2], all peripherals disabled	120 MHz	8.0	TBD	TBD	
			90 MHz	6.5	TBD	TBD	
			60 MHz	5.0	TBD	TBD	
			30 MHz	3.5	TBD	TBD	
			26 MHz	TBD	TBD	TBD	
			16 MHz	TBD	TBD	TBD	

1. Based on characterization, tested in production at V_{DD} max and f_{HCLK} max with peripherals enabled.

2. External clock is 8 MHz and PLL is on when f_{HCLK} > 8 MHz.

3. Add an additional power consumption of 0.8 mA per ADC for the analog part. In applications, this consumption occurs only while the ADC is on (ADON bit is set in the ADC_CR2 register).

Table 18.   Typical and maximum current consumptions in Stop mode

Symbol	Parameter	Conditions	Typ[1]			Max		Unit
			V_{DD}/V_{BAT} = 1.8 V	V_{DD}/V_{BAT} = 2.4 V	V_{DD}/V_{BAT} = 3.3 V	T_A = 85 °C	T_A = 105 °C	
I_{DD_STOP}	Supply current in Stop mode with main regulator in Run mode	Flash in Stop mode, low-speed and high-speed internal RC oscillators and high-speed oscillator OFF (no independent watchdog)	350			TBD	TBD	µA
		Flash in Deep power down mode, low-speed and high-speed internal RC oscillators and high-speed oscillator OFF (no independent watchdog)	300			TBD	TBD	
	Supply current in Stop mode with main regulator in Low Power mode	Flash in Stop mode, low-speed and high-speed internal RC oscillators and high-speed oscillator OFF (no independent watchdog)	200					
		Flash in Deep power down mode, low-speed and high-speed internal RC oscillators and high-speed oscillator OFF (no independent watchdog)	150					

1. Typical values are measured at T_A = 25 °C.

Table 19.   Typical and maximum current consumptions in Standby mode

Symbol	Parameter	Conditions	Typ[1]			Max		Unit
			V_{DD}/V_{BAT} = 1.8 V	V_{DD}/V_{BAT} = 2.4 V	V_{DD}/V_{BAT} = 3.3 V	T_A = 85 °C	T_A = 105 °C	
I_{DD_STBY}	Supply current in Standby mode	Backup SRAM ON, RTC ON	4			TBD[2]	TBD[2]	µA
		Backup SRAM OFF, RTC ON	3.3			TBD[2]	TBD[2]	
		Backup SRAM ON, RTC OFF	3.2			TBD[2]	TBD[2]	
		Backup SRAM OFF, RTC OFF	2.5			TBD[2]	TBD[2]	

1. Typical values are measured at T_A = 25 °C.

2. Based on characterization, not tested in production.

Table 20.   Typical and maximum current consumptions in VBAT mode

Symbol	Parameter	Conditions	Typ[1]			Max		Unit
			V_{DD}/V_{BAT} = 1.8 V	V_{DD}/V_{BAT} = 2.4 V	V_{DD}/V_{BAT} = 3.3 V	T_A = 85 °C	T_A = 105 °C	
I_{DD_VBAT}	Backup domain supply current	Backup SRAM OFF, low-speed oscillator and RTC ON	0.8			TBD[2]	TBD[2]	µA
		Backup SRAM ON, RTC ON	1.5			TBD[2]	TBD[2]	
		Backup SRAM OFF, RTC OFF	0			TBD[2]	TBD[2]	
		Backup SRAM ON, RTC OFF	0.7			TBD[2]	TBD[2]	

1. Typical values are measured at T_A = 25 °C.

2. Based on characterization, not tested in production.

On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in *Table 21*. The MCU is placed under the following conditions:

●   all I/O pins are in input mode with a static value at V_{DD} or V_{SS} (no load)

●   all peripherals are disabled unless otherwise mentioned

●   the given value is calculated by measuring the current consumption

  –   with all peripherals clocked off

  –   with one peripheral clocked on (with only the clock applied)

●   ambient operating temperature and V_{DD} supply voltage conditions summarized in *Table 7*.

Table 21.   Peripheral current consumption

Peripheral[1]		Typical consumption at 25 °C	Unit
AHB1	GPIO A	TBD	mA
	GPIO B	TBD	
	GPIO C	TBD	
	GPIO D	TBD	
	GPIO E	TBD	
	GPIO F	TBD	
	GPIO G	TBD

	ADC3	TBD	
	SPI1	TBD	
	USART1	TBD	
	USART6	TBD	

1. f_{HCLK} = 120 MHz, f_{APB1} = f_{HCLK}/4, f_{APB2} = f_{HCLK}/2, default prescaler value for each peripheral.

2. Specific conditions for ADC: f_{HCLK} = 120 MHz, f_{APB1} = f_{HCLK}/4, f_{APB2} = f_{HCLK}/2, f_{ADCCLK} = f_{APB2}/2, ADON bit in the ADC_CR2 register is set to 1.

5.3.6 External clock source characteristics

High-speed external user clock generated from an external source

The characteristics given in *Table 22* result from tests performed using an high-speed external clock source, and under ambient temperature and supply voltage conditions summarized in *Table 10*.

Table 22. High-speed external user clock characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSE_ext}	External user clock source frequency[1]		1	8	50	MHz
V_{HSEH}	OSC_IN input pin high level voltage		$0.7V_{DD}$		V_{DD}	V
V_{HSEL}	OSC_IN input pin low level voltage		V_{SS}		$0.3V_{DD}$	
$t_{w(HSE)}$ $t_{w(HSE)}$	OSC_IN high or low time[1]		16			ns
$t_{r(HSE)}$ $t_{f(HSE)}$	OSC_IN rise or fall time[1]				20	
$C_{in(HSE)}$	OSC_IN input capacitance[1]			5		pF
$DuCy_{(HSE)}$	Duty cycle		45		55	%
I_L	OSC_IN Input leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$			±1	µA

1. Guaranteed by design, not tested in production.

Low-speed external user clock generated from an external source

The characteristics given in *Table 23* result from tests performed using an low-speed external clock source, and under ambient temperature and supply voltage conditions summarized in *Table 10*.

Table 23. Low-speed external user clock characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{LSE_ext}	User External clock source frequency[1]			32.768	1000	kHz
V_{LSEH}	OSC32_IN input pin high level voltage		$0.7V_{DD}$		V_{DD}	V
V_{LSEL}	OSC32_IN input pin low level voltage		V_{SS}		$0.3V_{DD}$	
$t_{w(LSE)}$ $t_{w(LSE)}$	OSC32_IN high or low time[1]		450			ns
$t_{r(LSE)}$ $t_{f(LSE)}$	OSC32_IN rise or fall time[1]				50	
$C_{in(LSE)}$	OSC32_IN input capacitance[1]			5		pF
$DuCy_{(LSE)}$	Duty cycle		30		70	%
I_L	OSC32_IN Input leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$			±1	µA

1. Guaranteed by design, not tested in production.

Figure 21.   High-speed external clock source AC timing diagram
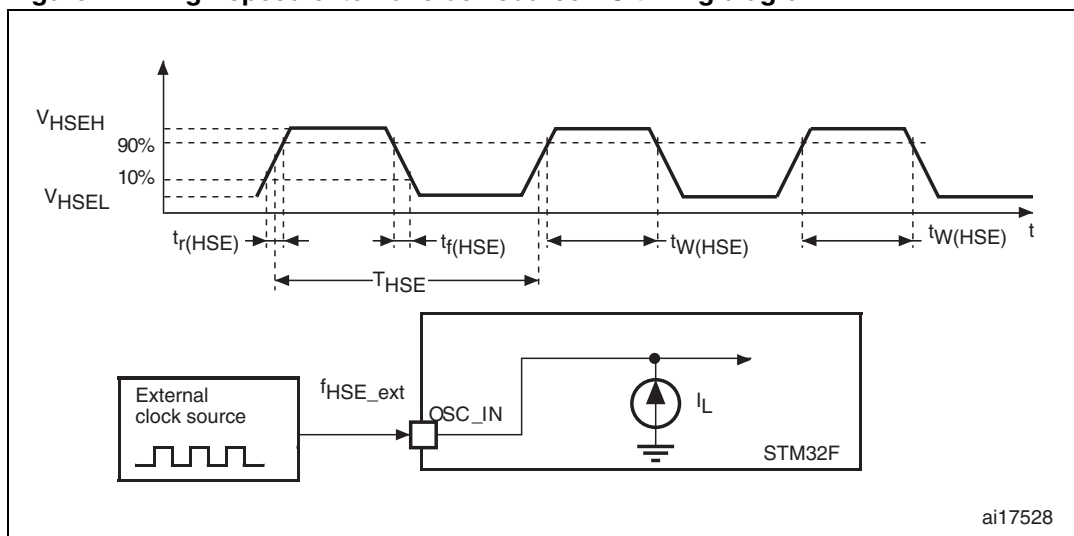

Figure 22.   Low-speed external clock source AC timing diagram
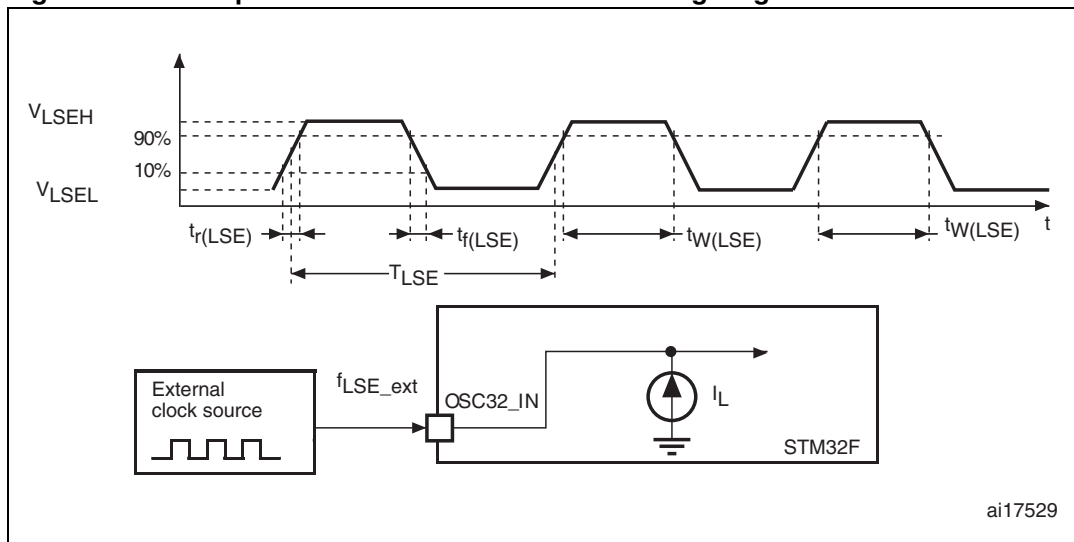

High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 4 to 26 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in *Table 24*. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 24.   HSE 4-26 MHz oscillator characteristics[1] [2]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{OSC_IN}	Oscillator frequency		4		26	MHz
R_F	Feedback resistor			200		kΩ
C	Recommended load capacitance versus equivalent serial resistance of the crystal (R_S)[3]	$R_S = 30\ \Omega$		30		pF
i_2	HSE driving current	$V_{DD} = 3.3$ V, $V_{IN} = V_{SS}$ with 30 pF load			1	mA
g_m	Oscillator transconductance	Startup	25			mA/V
$t_{SU(HSE}$[4]	Startup time	V_{DD} is stabilized		2		ms

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.

2. Based on characterization, not tested in production.

3. The relatively low value of the RF resistor offers a good protection against issues resulting from use in a humid environment, due to the induced leakage and the bias condition change. However, it is recommended to take this point into account if the MCU is used in tough humidity conditions.

4. $t_{SU(HSE)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

For C_{L1} and C_{L2}, it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see *Figure 23*). C_{L1} and C_{L2} are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of C_{L1} and C_{L2}. PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing C_{L1} and C_{L2}. Refer to the application note AN2867 "Oscillator design guide for ST microcontrollers" available from the ST website www.st.com.

Figure 23.   Typical application with an 8 MHz crystal
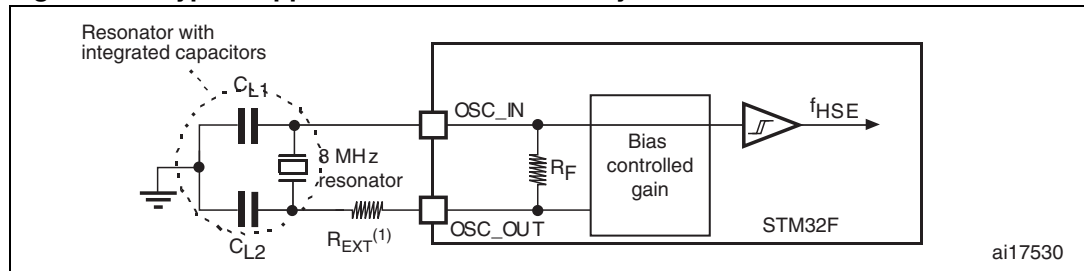

1. R_{EXT} value depends on the crystal characteristics.

Low-speed external clock generated from a crystal/ceramic resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in *Table 25*. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 25.   LSE oscillator characteristics (f_{LSE} = 32.768 kHz) [1]

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
R_F	Feedback resistor			5		MΩ
C [2]	Recommended load capacitance versus equivalent serial resistance of the crystal (R_S) [3]	R_S = 30 kΩ			15	pF
I_2	LSE driving current	V_{DD} = 3.3 V, V_{IN} = V_{SS}			1.4	µA
g_m	Oscillator Transconductance		5			µA/V
$t_{SU(LSE)}$ [4]	startup time	V_{DD} is stabilized		3		s

1. Based on characterization, not tested in production.

2. Refer to the note and caution paragraphs below the table, and to the application note AN2867 "Oscillator design guide for ST microcontrollers".

3. The oscillator selection can be optimized in terms of supply current using an high quality resonator with small R_S value for example MSIV-TIN32.768kHz. Refer to crystal manufacturer for more details

4. $t_{SU(LSE)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

Note: *For C_{L1} and C_{L2} it is recommended to use high-quality external ceramic capacitors in the 5 pF to 15 pF range selected to match the requirements of the crystal or resonator (see Figure 24). C_{L1} and C_{L2} are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of C_{L1} and C_{L2}.*
Load capacitance C_L has the following formula: $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$ where C_{stray} is the pin capacitance and board or trace PCB-related capacitance. Typically, it is between 2 pF and 7 pF.

Caution: To avoid exceeding the maximum value of C_{L1} and C_{L2} (15 pF) it is strongly recommended to use a resonator with a load capacitance $C_L \leq$ 7 pF. Never use a resonator with a load capacitance of 12.5 pF.
Example: if you choose a resonator with a load capacitance of C_L = 6 pF, and C_{stray} = 2 pF, then $C_{L1} = C_{L2}$ = 8 pF.

Figure 24.   Typical application with a 32.768 kHz crystal
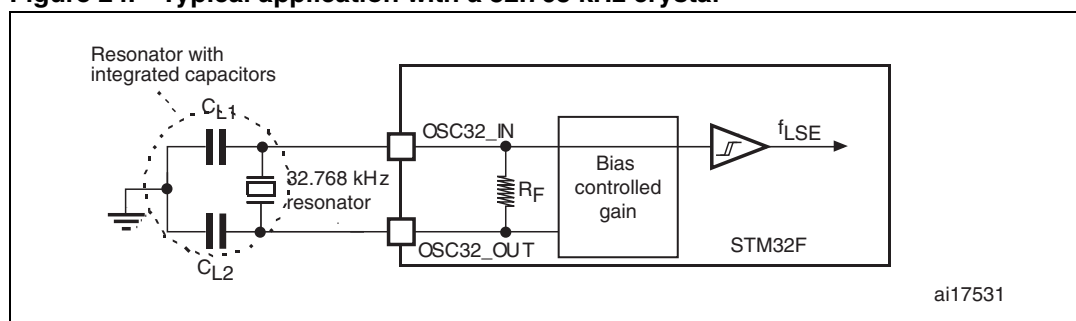

5.3.7 Internal clock source characteristics

The parameters given in *Table 26* are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 10*.

High-speed internal (HSI) RC oscillator

Table 26.   HSI oscillator characteristics [1]

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
f_{HSI}	Frequency				16		MHz
ACC_{HSI}	Accuracy of the HSI oscillator	User-trimmed with the RCC_CR register[2]				TBD	%
		Factory-calibrated	T_A = –40 to 105 °C	TBD		TBD	%
			T_A = –10 to 85 °C	TBD		TBD	%
			T_A = 0 to 70 °C	TBD		TBD	%
			T_A = 25 °C	TBD		TBD	%
$t_{su(HSI)}$	HSI oscillator startup time			TBD		TBD	µs
$I_{DD(HSI)}$	HSI oscillator power consumption				80	TBD	µA

1. V_{DD} = 3.3 V, T_A = –40 to 105 °C unless otherwise specified.

2. Refer to application note AN2868 "STM32F10xxx internal RC oscillator (HSI) calibration" available from the ST website www.st.com.

Low-speed internal (LSI) RC oscillator

Table 27.   LSI oscillator characteristics [1]

Symbol	Parameter	Min	Typ	Max	Unit
f_{LSI}[2]	Frequency	30	32	60	kHz
$t_{su(LSI)}$[3]	LSI oscillator startup time		85	TBD	µs
$I_{DD(LSI)}$[3]	LSI oscillator power consumption		0.65	TBD	µA

1. V_{DD} = 3 V, T_A = –40 to 105 °C unless otherwise specified.

2. Based on characterization, not tested in production.

3. Guaranteed by design, not tested in production.

5.3.8 Wakeup time from low-power mode

The wakeup times given in *Table 28* is measured on a wakeup phase with a 16 MHz HSI RC oscillator. The clock source used to wake up the device depends from the current operating mode:

●   Stop or Standby mode: the clock source is the RC oscillator

●   Sleep mode: the clock source is the clock that was set before entering Sleep mode.

All timings are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 10*.

Table 28. Low-power mode wakeup timings

Symbol	Parameter	Typ	Unit
$t_{WUSLEEP}$[1]	Wakeup from Sleep mode	1	µs
t_{WUSTOP}[1]	Wakeup from Stop mode (regulator in run mode)	9	µs
	Wakeup from Stop mode (regulator in low power mode)	15	
	Wakeup from Stop mode (regulator in low power mode and Flash memory in Deep power down mode)	110	
$t_{WUSTDBY}$[1]	Wakeup from Standby mode	200	µs

1. The wakeup times are measured from the wakeup event to the point in which the user application code reads the first instruction.

5.3.9 PLL characteristics

The parameters given in *Table 29* and *Table 30* are derived from tests performed under temperature and V_{DD} supply voltage conditions summarized in *Table 10*.

Table 29. Main PLL characteristics

Symbol	Parameter	Conditions	Min[1]	Typ[1]	Max[1]	Unit
f_{PLL_IN}	PLL input clock[2]		0.95	1	2.00	MHz
f_{PLL_OUT}	PLL multiplier output clock		24		120	MHz
f_{PLL48_OUT}	48 MHz PLL multiplier output clock				48	MHz
f_{VCO_OUT}	PLL VCO output		192		432	MHz
t_{LOCK}	PLL lock time				350	µs
Jitter	Cycle-to-cycle jitter	System clock 120 MHz			300	ps
$I_{DD(PLL)}$	PLL power consumption on VDD	VCO freq = 192 MHz VCO freq = 432 MHz	TBC		TBC	mA
$I_{DDA(PLL)}$	PLL power consumption on VDDA	VCO freq = 192 MHz VCO freq = 432 MHz	TBC		TBC	mA

1. Based on characterization, not tested in production.

2. Take care of using the appropriate division factor M to obtain the specified PLL input clock values. The M factor is shared between PLL and PLLI2S.

Table 30. PLLI2S (audio PLL) characteristics

Symbol	Parameter	Conditions	Min[1]	Typ[1]	Max[1]	Unit
f_{PLLI2S_IN}	PLLI2S input clock[2]		0.95	1	1.05	MHz
f_{PLLI2S_OUT}	PLLI2S multiplier output clock				216	MHz
f_{VCO_OUT}	PLLI2S VCO output		192		432	MHz
t_{LOCK}	PLLI2S lock time				350	µs
Jitter	Cycle-to-cycle jitter	System clock 120 MHz			300	ps

Table 30.   PLLI2S (audio PLL) characteristics (continued)

Symbol	Parameter	Conditions	Min[1]	Typ[1]	Max[1]	Unit
Jitter	Master I2S clock jitter	Cycle to cycle at 12,343 KHz on 48KHz period N=432, P=4, R=5	TBC		TBC	ps
Jitter	Master I2S clock jitter	Average frequency of 12,343 KHz N=432, P=4, R=5 on 256 samples	TBC		TBC	ps
Jitter	WS I2S clock jitter	Cycle to cycle at 48 KHz on 1000 samples	TBC		TBC	ps
Jitter	Main Clock Output for Ethernet	Cycle to cycle at 50 MHz on 1000 samples	TBC		TBC	ps
Jitter	Bit Time CAN Jitter	Cycle to cycle at 1 MHz on 1000 samples	TBC		TBC	ps
$I_{DD(PLLI2S)}$	PLLI2S power consumption on V_{DD}	VCO freq = 192 MHz VCO freq = 432 MHz	TBC		TBC	mA
$I_{DDA(PLLI2S)}$	PLLI2S power consumption on V_{DDA}	VCO freq = 192 MHz VCO freq = 432 MHz	TBC		TBC	mA

1. Based on characterization, not tested in production.

2. Take care of using the appropriate division factor M to have the specified PLL input clock values.

5.3.10   PLL spread spectrum clock generation (SSCG) characteristics

The spread spectrum clock generation (SSCG) feature is only available on the main PLL.

Table 31.   SSCG parameters constraint

Symbol	Parameter	Min	Typ	Max	Unit
f_{Mod}	Modulation frequency			10	KHz
md	Peak modulation depth	0.5		2	dec
MODEPER * INCSTEP				$2^{15}-1$	dec

Equation 1

The frequency modulation period (MODEPER) is given by the equation below:

$$MODEPER = round[f_{PLL\_IN}/(4 \times f_{Mod})]$$

Equation 2

Equation 2 allows to calculate the increment step (INCSTEP):

$$INCSTEP = round[((2^{15} - 1) \times md \times f_{VCO\_OUT}) / (100 \times 5 \times MODEPER)]$$

An amplitude quantization error may be generated because the linear modulation profile is obtained by taking the quantized values (rounded to the nearest integer) of MODPER and INCSTEP. As a result, the achieved modulation depth is quantized. The percentage quantized modulation depth is given by the following formula:

$$md_{quantized}\% = (MODEPER \times INCSTEP \times 100 \times 5) / ((2^{15} - 1) \times f_{VCO\_OUT})$$

Figure 25 and *Figure 26* show the main PLL output clock waveforms in center spread and down spread modes, where:

F0 is f_{PLL_OUT} nominal.

T_{mode} is the modulation period.

md is the modulation depth.

**Figure 25. PLL output clock waveforms in center spread mode**

Figure 26. PLL output clock waveforms in down spread mode

5.3.11 Memory characteristics

Flash memory

The characteristics are given at T_A = –40 to 105 °C unless otherwise specified.

Table 32.   Flash memory characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
I_{DD}	Supply current	Read mode f_{HCLK} = 120 MHz with 3 wait states, V_{DD} = 3.3 V		TBD	mA
		Write / Erase modes f_{HCLK} = 120 MHz, V_{DD} = 3.3 V		TBD	mA
		Power-down mode / Halt, V_{DD} = 3.0 to 3.6 V		TBD	µA

Table 33.   Flash memory programming

Symbol	Parameter	Conditions	Min[1]	Typ	Max[1]	Unit
t_{prog}	Word programming time			12	100	µs
$t_{ERASE16KB}$	Sector (16 KB) erase time			400		ms
$t_{ERASE64KB}$	Sector (64 KB) erase time	T_A = –40 to +105 °C		700		ms
$t_{ERASE128KB}$	Sector (128 KB) erase time			1		s
t_{ME}	Mass erase time		TBD		TBD	ms
V_{prog}	Programming voltage	32-bit program operation	2.7		3.6	V
		16-bit program operation	2.1		3.6	V
		8-bit program operation	1.8		3.6	V

1. Guaranteed by design, not tested in production.

Table 34.   Flash memory programming with V_{PP}

Symbol	Parameter	Conditions	Min[1]	Typ	Max[1]	Unit
t_{prog}	Double word programming			7	60	µs
$t_{ERASE16KB}$	Sector (16 KB) erase time			TBD		
$t_{ERASE64KB}$	Sector (64 KB) erase time			TBD		
$t_{ERASE128KB}$	Sector (128 KB) erase time			TBD		
t_{ME}	Mass erase time			TBD		
V_{prog}	Programming voltage	T_A = 0 to +40 °C	2.7		3.6	V
V_{PP}	V_{PP} voltage range		7		9	V
I_{PP}	Minimum current sunk on the V_{PP} pin		10			mA
t_{VPP}[2]	Cumulative time during which V_{PP} is applied				1	hour

1. Guaranteed by design, not tested in production.

2. V_{PP} should only be connected during programming/erasing.

Table 35.   Flash memory endurance and data retention

Symbol	Parameter	Conditions	Value			Unit
			Min[1]	Typ	Max	
N_{END}	Endurance	T_A = –40 to +85 °C (6 suffix versions) T_A = –40 to +105 °C (7 suffix versions)	10			kcycles
t_{RET}	Data retention	1 kcycle[2] at T_A = 85 °C	30			Years
		1 kcycle[2] at T_A = 105 °C	10			
		10 kcycles[2] at T_A = 55 °C	20			

1. Based on characterization, not tested in production.

2. Cycling performed over the whole temperature range.

5.3.12   EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports). the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

●   **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.

●   **FTB**: A burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in *Table 36*. They are based on the EMS levels and classes defined in application note AN1709.

Table 36.   EMS characteristics

Symbol	Parameter	Conditions	Level/ Class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	V_{DD} = 3.3 V, LQFP100, T_A = +25 °C, f_{HCLK} = 75 MHz, conforms to IEC 61000-4-2	2B
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	V_{DD} = 3.3 V, LQFP100, T_A = +25 °C, f_{HCLK} = 75 MHz, conforms to IEC 61000-4-2	4A

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Software recommendations

The software flowchart must include the management of runaway conditions such as:

● Corrupted program counter
● Unexpected reset
● Critical Data corruption (control registers...)

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with SAE IEC61967-2 standard which specifies the test board and the pin loading.

Table 37.   EMI characteristics

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. [f_{HSE}/f_{HCLK}]		Unit
				8/48 MHz	8/72 MHz	
S_{EMI}	Peak level	$V_{DD} = 3.3$ V, $T_A = 25$ °C, LQFP100 package compliant with IEC61967-2	0.1 to 30 MHz	9	9	dBμV
			30 to 130 MHz	26	13	
			130 MHz to 1GHz	25	31	
			SAE EMI Level	4	4	-

5.3.13   Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n+1) supply pins). This test conforms to the JESD22-A114/C101 standard.

Table 38. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Class	Maximum value[1]	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	T_A = +25 °C conforming to JESD22-A114	2	2000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)	T_A = +25 °C conforming to JESD22-C101	II	500	

1. Based on characterization results, not tested in production.

Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

● A supply overvoltage is applied to each power supply pin
● A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latch-up standard.

Table 39. Electrical sensitivities

Symbol	Parameter	Conditions	Class
LU	Static latch-up class	T_A = +105 °C conforming to JESD78A	II level A

5.3.14 I/O port characteristics

General input/output characteristics

Unless otherwise specified, the parameters given in *Table 40* are derived from tests performed under the conditions summarized in *Table 10*. All I/Os are CMOS and TTL compliant.

Table 40. I/O static characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IL}	Input low level voltage	TTL ports 2.7 V≤V_{DD}≤3.6 V	V_{SS}–0.3		0.8	V
V_{IH}	Standard I/O input high level voltage		2		V_{DD}+0.3	
	FT[1] I/O input high level voltage		2		5.5V	
V_{IL}	Input low level voltage	CMOS ports 1.65 V≤V_{DD}≤3.6 V	–0.3		0.3 V_{DD}	
V_{IH}	Standard I/O high level voltage	CMOS ports 1.65 V≤V_{DD}≤3.6 V	0.7 V_{DD}		V_{DD}+0.3	
	FT[1] I/O input high level voltage	CMOS ports 1.65 V≤V_{DD}≤3.6 V			5.25	
		CMOS ports 2.0 V≤V_{DD}≤3.6 V			5.5	
V_{hys}	Standard IO Schmitt trigger voltage hysteresis[2]		200			mV
	IO FT Schmitt trigger voltage hysteresis[2]		5% V_{DD}[3]			mV

Table 40.   I/O static characteristics (continued)

Symbol	Parameter		Conditions	Min	Typ	Max	Unit
I_{lkg}	Standard I/O input leakage current [4]		$V_{SS} \leq V_{IN} \leq V_{DD}$			± 1	μA
	FT I/O input leakage[4]		$V_{IN} = 5$ V			3	
R_{PU}	Weak pull-up equivalent resistor[5]	All pins except for PA10 and PB12	$V_{IN} = V_{SS}$	30	40	50	kΩ
		PA10 and PB12		8	11	15	
R_{PD}	Weak pull-down equivalent resistor[5]	All pins except for PA10 and PB12	$V_{IN} = V_{DD}$	30	40	50	kΩ
		PA10 and PB12		8	11	15	
C_{IO}[6]	I/O pin capacitance				5		pF

1. FT = Five-volt tolerant.

2. Hysteresis voltage between Schmitt trigger switching levels. Based on characterization, not tested in production.

3. With a minimum of 100 mV.

4. Leakage could be higher than max. if negative current is injected on adjacent pins.

5. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This MOS/NMOS contribution to the series resistance is minimum (~10% order).

6. Guaranteed by design, not tested in production.

All I/Os are CMOS and TTL compliant (no software configuration required), their characteristics consider the most strict CMOS-technology or TTL parameters:

- For V_{IH}:
    - if V_{DD} is in the [2.00 V - 3.08 V] range: CMOS characteristics but TTL included
    - if V_{DD} is in the [3.08 V - 3.60 V] range: TTL characteristics but CMOS included
- For V_{IL}:
    - if V_{DD} is in the [2.00 V - 2.28 V] range: TTL characteristics but CMOS included
    - if V_{DD} is in the [2.28 V - 3.60 V] range: CMOS characteristics but TTL included

Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to +/-8 mA, and sink +20 mA (with a relaxed V_{OL}).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in *Section 5.2*:

- The sum of the currents sourced by all the I/Os on $V_{DD,}$ plus the maximum Run consumption of the MCU sourced on $V_{DD,}$ cannot exceed the absolute maximum rating I_{VDD} (see *Table 8*).
- The sum of the currents sunk by all the I/Os on V_{SS} plus the maximum Run consumption of the MCU sunk on V_{SS} cannot exceed the absolute maximum rating I_{VSS} (see *Table 8*).

Output voltage levels

Unless otherwise specified, the parameters given in *Table 41* are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 10*. All I/Os are CMOS and TTL compliant.

Table 41. Output voltage characteristics[1]

Symbol	Parameter	Conditions	Min	Max	Unit
V_{OL}[2]	Output low level voltage for an I/O pin when 8 pins are sunk at same time	TTL port I_{IO} = +8 mA 2.7 V < V_{DD} < 3.6 V		0.4	V
V_{OH}[3]	Output high level voltage for an I/O pin when 8 pins are sourced at same time		V_{DD}–0.4		
V_{OL}[2]	Output low level voltage for an I/O pin when 8 pins are sunk at same time	CMOS port I_{IO} =+ 8mA 2.7 V < V_{DD} < 3.6 V		0.4	V
V_{OH}[3]	Output high level voltage for an I/O pin when 8 pins are sourced at same time		2.4		
V_{OL}[2][4]	Output low level voltage for an I/O pin when 8 pins are sunk at same time	I_{IO} = +20 mA 2.7 V < V_{DD} < 3.6 V		1.3	V
V_{OH}[3][4]	Output high level voltage for an I/O pin when 8 pins are sourced at same time		V_{DD}–1.3		
V_{OL}[2][4]	Output low level voltage for an I/O pin when 8 pins are sunk at same time	I_{IO} = +6 mA 2 V < V_{DD} < 2.7 V		0.4	V
V_{OH}[3][4]	Output high level voltage for an I/O pin when 8 pins are sourced at same time		V_{DD}–0.4		

1. PC13, PC14, PC15 and PI8 are supplied through the power switch. Since the switch only sinks a limited amount of current (3 mA), the use of GPIOs PC13 to PC15 and PI8 in output mode is limited: the speed should not exceed 2 MHz with a maximum load of 30 pF and these I/Os must not be used as a current source (e.g. to drive an LED).

2. The I_{IO} current sunk by the device must always respect the absolute maximum rating specified in *Table 8* and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VSS}.

3. The I_{IO} current sourced by the device must always respect the absolute maximum rating specified in *Table 8* and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VDD}.

4. Based on characterization data, not tested in production.

Input/output AC characteristics

The definition and values of input/output AC characteristics are given in *Figure 27* and *Table 42*, respectively.

Unless otherwise specified, the parameters given in *Table 42* are derived from tests performed under the ambient temperature and V_{DD} supply voltage conditions summarized in *Table 10*.

Table 42. I/O AC characteristics[1]

OSPEEDRy [1:0] bit value[1]	Symbol	Parameter	Conditions	Min	Typ	Max	Unit
00	$f_{max(IO)out}$	Maximum frequency[2]	C_L = 50 pF, V_{DD} = 1.8 V to 3.6 V			2	MHz
	$t_{f(IO)out}$	Output high to low level fall time	C_L = 50 pF, V_{DD} = 1.8 V to 3.6 V			TBD[3]	ns
	$t_{r(IO)out}$	Output low to high level rise time				TBD [3]	

Table 42.   I/O AC characteristics[1] (continued)

OSPEEDRy [1:0] bit value[1]	Symbol	Parameter	Conditions	Min	Typ	Max	Unit
01	$f_{max(IO)out}$	Maximum frequency[2]	C_L = 50 pF, V_{DD} < 2.7 V	25		TBD	MHz
			C_L = 10 pF, V_{DD} > 2.7 V	25		50[4]	MHz
	$t_{f(IO)out}$	Output high to low level fall time	C_L = 50 pF, V_{DD} < 2.7 V			TBD[3]	ns
			C_L = 10 pF, V_{DD} > 2.7 V			TBD[3]	
	$t_{r(IO)out}$	Output low to high level rise time	C_L = 50 pF, V_{DD} < 2.7 V			TBD[3]	
			C_L = 10 pF, V_{DD} > 2.7 V			TBD[3]	
10	$f_{max(IO)out}$	Maximum frequency[2]	C_L = 50 pF, 2.4 < V_{DD} < 2.7 V	50[4]		TBD	MHz
			C_L = 10 pF, V_{DD} > 2.7 V	50[4]		100[4]	MHz
	$t_{f(IO)out}$	Output high to low level fall time	C_L = 50 pF, 2.4 < V_{DD} < 2.7 V			TBD[3]	ns
			C_L = 10 pF, V_{DD} > 2.7 V			TBD[3]	
	$t_{r(IO)out}$	Output low to high level rise time	C_L = 50 pF, 2.4 < V_{DD} < 2.7 V			TBD[3]	
			C_L = 10 pF, V_{DD} > 2.7 V			TBD[3]	
11	$F_{max(IO)out}$	Maximum frequency[2]	C_L = 20 pF, 2.4 < V_{DD} < 2.7 V	100[4]		TBD	MHz
			C_L = 10 pF, V_{DD} > 2.7 V	100[4]		200[4]	MHz
	$t_{f(IO)out}$	Output high to low level fall time	C_L = 20 pF, 2.4 < V_{DD} < 2.7 V			TBD[3]	ns
			C_L = 10 pF, V_{DD} > 2.7 V			TBD[3]	
	$t_{r(IO)out}$	Output low to high level rise time	C_L = 20 pF, 2.4 < V_{DD} < 2.7 V			TBD[3]	
			C_L = 10 pF, V_{DD} > 2.7 V			TBD[3]	
-	t_{EXTIpw}	Pulse width of external signals detected by the EXTI controller		10			ns

1. The I/O speed is configured using the OSPEEDRy[1:0] bits. Refer to the STM32F20/21xxx reference manual for a description of the GPIOx_SPEEDR GPIO port output speed register.

2. The maximum frequency is defined in *Figure 27*.

3. Guaranteed by design, not tested in production.

4. For maximum frequencies above 50 MHz, it is required to use the compensation cell.

Figure 27. I/O AC characteristics definition
5.3.15 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor, R_{PU} (see *Table 40*).

Unless otherwise specified, the parameters given in *Table 43* are derived from tests performed under the ambient temperature and V_{DD} supply voltage conditions summarized in *Table 10*.

Table 43. NRST pin characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{IL(NRST)}$[1]	NRST Input low level voltage		−0.5		0.8	V
$V_{IH(NRST)}$[1]	NRST Input high level voltage		2		V_{DD}+0.5	
$V_{hys(NRST)}$	NRST Schmitt trigger voltage hysteresis			200		mV
R_{PU}	Weak pull-up equivalent resistor[2]	$V_{IN} = V_{SS}$	30	40	50	kΩ
$V_{F(NRST)}$[1]	NRST Input filtered pulse				100	ns
$V_{NF(NRST)}$[1]	NRST Input not filtered pulse	$V_{DD} > 2.7$ V	300			ns
T_{NRST_OUT}	Generated reset pulse duration	Internal Reset source	20			μs

1. Guaranteed by design, not tested in production.

2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum (~10% order).

Figure 28.   Recommended NRST pin protection
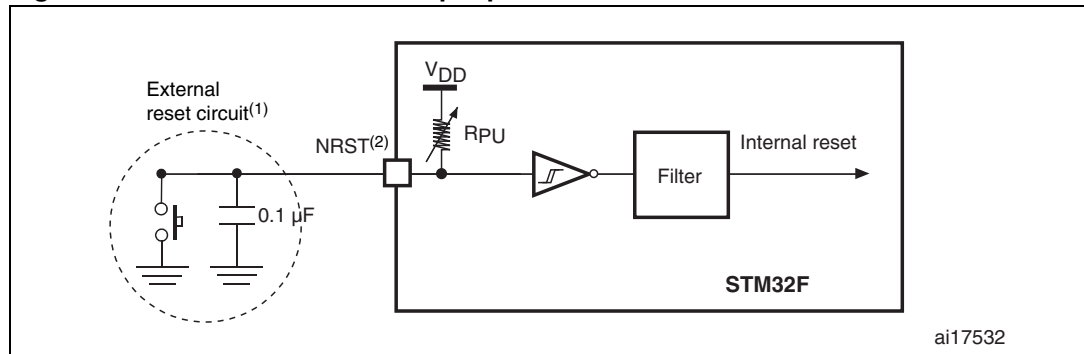

2. The reset network protects the device against parasitic resets.

3. The user must ensure that the level on the NRST pin can go below the $V_{IL(NRST)}$ max level specified in
   Table 43. Otherwise the reset is not taken into account by the device.

5.3.16   TIM timer characteristics

The parameters given in *Table 44* and *Table 45* are guaranteed by design.

Refer to *Section 5.3.14: I/O port characteristics* for details on the input/output alternate
function characteristics (output compare, input capture, external clock, PWM output).

Table 44.   Characteristics of TIMx connected to the APB1 domain[1]

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time		1		$t_{TIMxCLK}$
			16.7		ns
f_{EXT}	Timer external clock frequency on CH1 to CH4		0	$f_{TIMxCLK}/2$	MHz
			0	36	MHz
Res_{TIM}	Timer resolution	$f_{TIMxCLK}$ = 60 MHz APB1= 30 MHz		16	bit
$t_{COUNTER}$	16-bit counter clock period when internal clock is selected		1	65536	$t_{TIMxCLK}$
			0.0167	1092	μs
	32-bit counter clock period when internal clock is selected		1		$t_{TIMxCLK}$
			0.0167	71582788	μs
t_{MAX_COUNT}	Maximum possible count			65536 × 65536	$t_{TIMxCLK}$
				71.6	s

1. TIMx is used as a general term to refer to the TIM2, TIM3, TIM4, TIM5, TIM6, TIM7, and TIM12 timers.

Table 45. Characteristics of TIMx connected to the APB2 domain[1]

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time	$f_{TIMxCLK} = 120$ MHz APB2 = 60 MHz	1		$t_{TIMxCLK}$
			8.3		ns
f_{EXT}	Timer external clock frequency on CH1 to CH4		0	$f_{TIMxCLK}/2$	MHz
			0	30	MHz
Res_{TIM}	Timer resolution			16	bit
$t_{COUNTER}$	16-bit counter clock period when internal clock is selected		1	65536	$t_{TIMxCLK}$
			0.0083	546	μs
t_{MAX_COUNT}	Maximum possible count			65536×65536	$t_{TIMxCLK}$
				35.79	s

1. TIMx is used as a general term to refer to the TIM1, TIM8, TIM9, TIM10, and TIM11 timers.

5.3.17   Communications interfaces

I^{2}C interface characteristics

Unless otherwise specified, the parameters given in *Table 46* are derived from tests performed under the ambient temperature, f_{PCLK1} frequency and V_{DD} supply voltage conditions summarized in *Table 10*.

The STM32F20x and STM32F205xx I^{2}C interface meets the requirements of the standard I^{2}C communication protocol with the following restrictions: the I/O pins SDA and SCL are mapped to are not "true" open-drain. When configured as open-drain, the PMOS connected between the I/O pin and V_{DD} is disabled, but is still present.

The I^{2}C characteristics are described in *Table 46*. Refer also to *Section 5.3.14: I/O port characteristics* for more details on the input/output alternate function characteristics (SDA and SCL).

Table 46.   I^{2}C characteristics

Symbol	Parameter	Standard mode I^{2}C[1]		Fast mode I^{2}C[1][2]		Unit
		Min	Max	Min	Max	
$t_{w(SCLL)}$	SCL clock low time	4.7		1.3		μs
$t_{w(SCLH)}$	SCL clock high time	4.0		0.6		
$t_{su(SDA)}$	SDA setup time	250		100		ns
$t_{h(SDA)}$	SDA data hold time	0[3]		0[4]	900[3]	
$t_{r(SDA)}$ $t_{r(SCL)}$	SDA and SCL rise time		1000	$20 + 0.1C_b$	300	
$t_{f(SDA)}$ $t_{f(SCL)}$	SDA and SCL fall time		300		300	
$t_{h(STA)}$	Start condition hold time	4.0		0.6		μs
$t_{su(STA)}$	Repeated Start condition setup time	4.7		0.6		
$t_{su(STO)}$	Stop condition setup time	4.0		0.6		μs
$t_{w(STO:STA)}$	Stop to Start condition time (bus free)	4.7		1.3		μs
C_b	Capacitive load for each bus line		400		400	pF

1.   Guaranteed by design, not tested in production.

2. f_{PCLK1} must be higher than 2 MHz to achieve the maximum standard mode I^{2}C frequency. It must be higher than 4 MHz to achieve the maximum fast mode I^{2}C frequency.

3.   The maximum hold time of the Start condition has only to be met if the interface does not stretch the low period of SCL signal.

4.   The device must internally provide a hold time of at least 300ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL.

Figure 29. I²C bus AC waveforms and measurement circuit
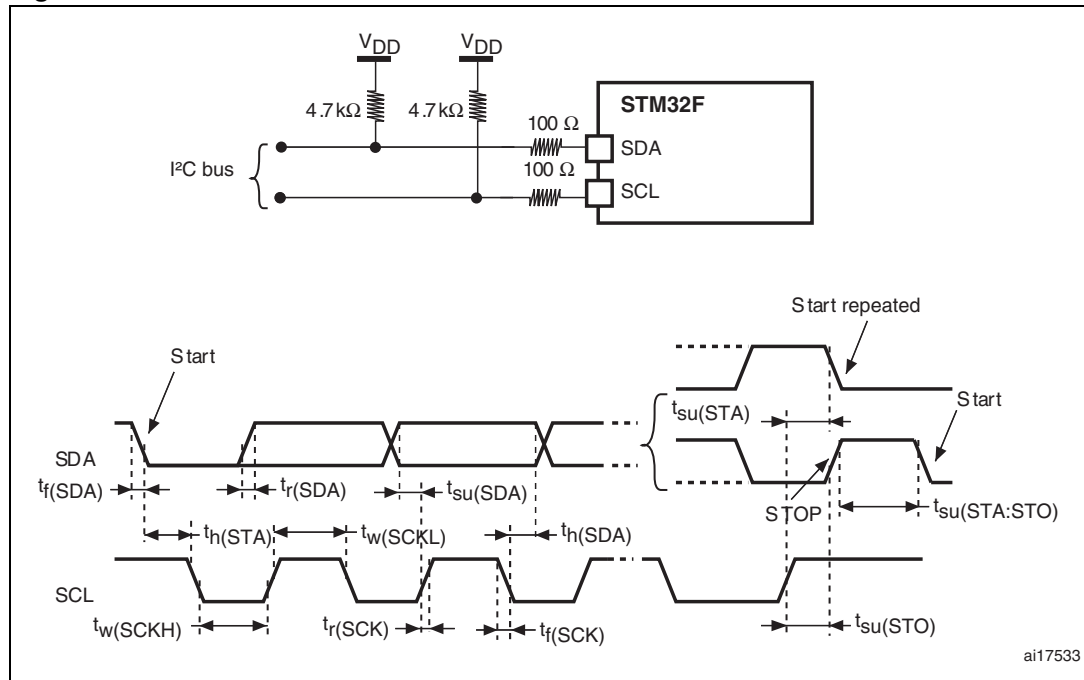

1. Measurement points are done at CMOS levels: $0.3V_{DD}$ and $0.7V_{DD}$.

Table 47. SCL frequency (f_{PCLK1}= 30 MHz.,V_{DD} = 3.3 V)[1][2]

f_{SCL} (kHz)	I2C_CCR value
	R_P = 4.7 kΩ
400	0x8019
300	0x8021
200	0x8032
100	0x0096
50	0x012C
20	0x02EE

1. R_P = External pull-up resistance, f_{SCL} = I²C speed,

2. For speeds around 200 kHz, the tolerance on the achieved speed is of ±5%. For other speed ranges, the tolerance on the achieved speed ±2%. These variations depend on the accuracy of the external components used to design the application.

I^2S - SPI interface characteristics

Unless otherwise specified, the parameters given in *Table 48* for SPI or in *Table 49* for I^2S are derived from tests performed under the ambient temperature, f_{PCLKx} frequency and V_{DD} supply voltage conditions summarized in *Table 10*.

Refer to *Section 5.3.14: I/O port characteristics* for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI and WS, CK, SD for I^2S).

Table 48. SPI characteristics[1]

Symbol	Parameter	Conditions	Min	Max	Unit
f_{SCK} $1/t_{c(SCK)}$	SPI clock frequency	Master mode		30	MHz
		Slave mode		30	
$t_{r(SCK)}$ $t_{f(SCK)}$	SPI clock rise and fall time	Capacitive load: C = 30 pF		8	ns
DuCy(SCK)	SPI slave input clock duty cycle	Slave mode	30	70	%
$t_{su(NSS)}$[2]	NSS setup time	Slave mode	4 t_{PCLK}		ns
$t_{h(NSS)}$[2]	NSS hold time	Slave mode	2 t_{PCLK}

$t_{su(MI)}$[2] $t_{su(SI)}$[2]	Data input setup time	Master mode	5		
		Slave mode	5		
$t_{h(MI)}$[2] $t_{h(SI)}$[2]	Data input hold time	Master mode	5		
		Slave mode	4		
$t_{a(SO)}$[2][3]	Data output access time	Slave mode, f_{PCLK} = 20 MHz	0	3 t_{PCLK}	
$t_{dis(SO)}$[2][4]	Data output disable time	Slave mode	2	10	
$t_{v(SO)}$[2][1]	Data output valid time	Slave mode (after enable edge)		25	
$t_{v(MO)}$[2][1]	Data output valid time	Master mode (after enable edge)		5	
$t_{h(SO)}$[2]	Data output hold time	Slave mode (after enable edge)	15		
$t_{h(MO)}$[2]		Master mode (after enable edge)	2		

1. Remapped SPI1 characteristics to be determined.

2. Based on characterization, not tested in production.

3. Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.

4. Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z

**Figure 30. SPI timing diagram - slave mode and CPHA = 0**

		f_{PCLK} = TBD	TBD	TBD	
$t_{h(SD\_MT)}$ [2]	Data output hold time	Master transmitter (after enable edge)	TBD		

1. TBD = to be determined.

2. Based on design simulation and/or characterization results, not tested in production.

3. Depends on f_{PCLK}. For example, if f_{PCLK}=8 MHz, then $T_{PCLK} = 1/f_{PLCLK}$ =125 ns.

Figure 33. I²S slave timing diagram (Philips protocol)[1]
1. Measurement points are done at CMOS levels: $0.3 \times V_{DD}$ and $0.7 \times V_{DD}$.

2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 34. I²S master timing diagram (Philips protocol)[1]
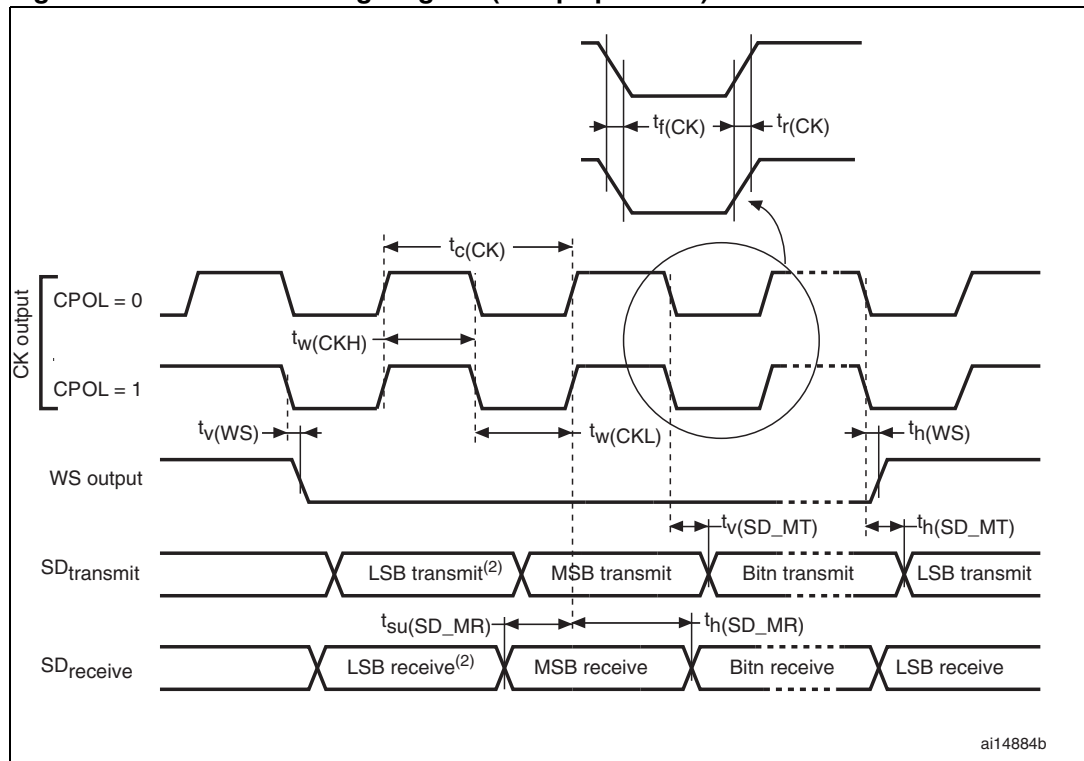

1. Based on characterization, not tested in production.

2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

USB OTG FS characteristics

The USB OTG interface is USB-IF certified (Full-Speed). This interface is present in both the USB OTG HS and USB OTG FS controllers.

Table 50.   USB OTG FS startup time

Symbol	Parameter	Max	Unit
$t_{STARTUP}$[1]	USB OTG FS transceiver startup time	1	µs

1. Guaranteed by design, not tested in production.

Table 51.   USB OTG FS DC electrical characteristics

Symbol		Parameter	Conditions	Min.[1]	Typ.	Max.[1]	Unit
Input levels	V_{DD}	USB OTG FS operating voltage		3.0[2]		3.6	V
	V_{DI}[3]	Differential input sensitivity	I(USB_FS_DP/DM, USB_HS_DP/DM)	0.2			V
	V_{CM}[3]	Differential common mode range	Includes V_{DI} range	0.8		2.5	
	V_{SE}[3]	Single ended receiver threshold		1.3		2.0	
Output levels	V_{OL}	Static output level low	R_L of 1.5 kΩ to 3.6 V[4]			0.3	V
	V_{OH}	Static output level high	R_L of 15 kΩ to V_{SS}[4]	2.8		3.6	
R_{PD}		PA11, PA12, PB14, PB15 (USB_FS_DP/DM, USB_HS_DP/DM)	$V_{IN} = V_{DD}$	17	21	24	kΩ
		PA9, PB13 (OTG_FS_VBUS, OTG_HS_VBUS)		0.65	1.1	2.0	
R_{PU}		PA12, PB15 (USB_FS_DP, USB_HS_DP)	$V_{IN} = V_{SS}$	1.5	1.8	2.1	
		PA9, PB13 (OTG_FS_VBUS, OTG_HS_VBUS)	$V_{IN} = V_{SS}$	0.25	0.37	0.55	

1. All the voltages are measured from the local ground potential.

2. The STM32F20x and STM32F205xx USB OTG FS functionality is ensured down to 2.7 V but not the full USB OTG FS electrical characteristics which are degraded in the 2.7-to-3.0 V V_{DD} voltage range.

3. Guaranteed by design, not tested in production.

4. R_L is the load connected on the USB OTG FS drivers

**Figure 35. USB OTG FS timings: definition of data signal rise and fall time**

Table 52. **USB OTG FS electrical characteristics**[1]

Driver characteristics					
Symbol	**Parameter**	**Conditions**	**Min**	**Max**	**Unit**
t_r	Rise time[2]	C_L = 50 pF	4	20	ns
t_f	Fall time[2]	C_L = 50 pF	4	20	ns
t_{rfm}	Rise/ fall time matching	t_r/t_f	90	110	%
V_{CRS}	Output signal crossover voltage		1.3	2.0	V

1. Guaranteed by design, not tested in production.

2. Measured from 10% to 90% of the data signal. For more detailed informations, please refer to USB Specification - Chapter 7 (version 2.0).

USB HS characteristics

Table 53. **Clock timing parameters**

Parameter[1]		**Symbol**	**Min**	**Nominal**	**Max**	**Unit**
Frequency (first transition)	8-bit ±10%	F_{START_8BIT}	54	60	66	MHz
Frequency (steady state) ±500 ppm		F_{STEADY}	59.97	60	60.03	MHz
Duty cycle (first transition)	8-bit ±10%	D_{START_8BIT}	40	50	60	%
Duty cycle (steady state) ±500 ppm		D_{STEADY}	49.975	50	50.025	%
Time to reach the steady state frequency and duty cycle after the first transition		T_{STEADY}			1.4	ms
Clock startup time after the de-assertion of SuspendM	Peripheral	T_{START_DEV}			5.6	ms
	Host	T_{START_HOST}				
PHY preparation time after the first transition of the input clock		T_{PREP}				µs
Jitter		T_{JITTER}				ps
Rise time Fall time		T_{RISE} T_{FALL}				ns

1. Guaranteed by design, not tested in production.

Figure 36. ULPI timing diagram
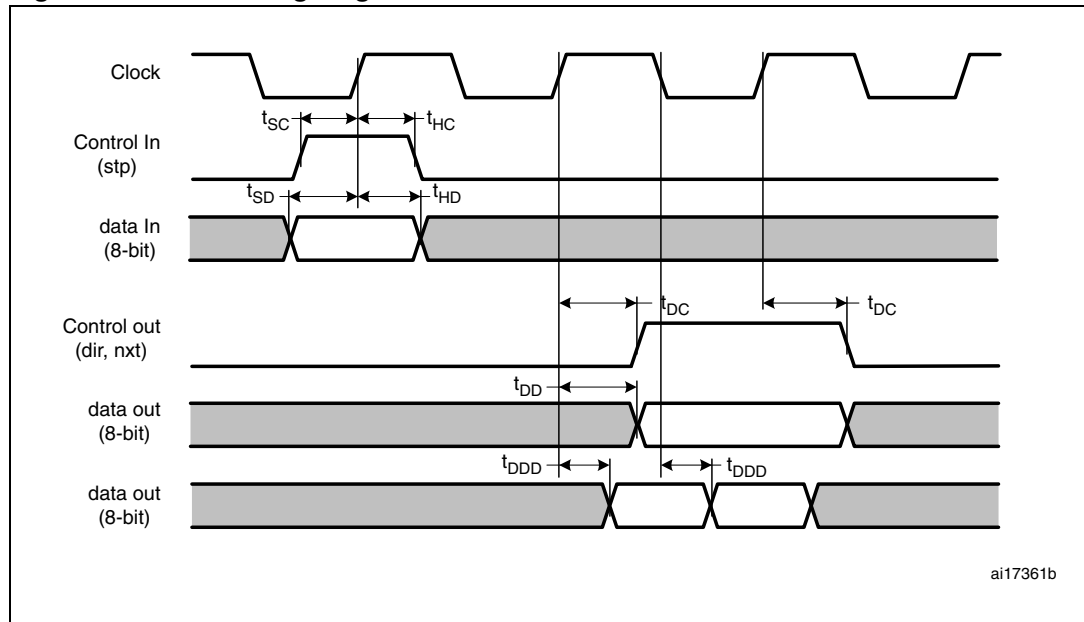

Table 54. ULPI timing

Parameter		Symbol	Value[1]		Unit
			Min.	Max.	
Output clock	Setup time (control in)	t_{SC}, t_{SD}		6.0	ns
	Hold time (control in)	t_{HC}, t_{HD}	0.0		ns
	Output delay (control out)	t_{DC}, t_{DD}		9.0	ns
Input clock (optional)	Setup time (control in)	t_{SC}, t_{SD}		3.0	ns
	Hold time (control in)	t_{HC}, t_{HD}	1.5		ns
	Output delay (control out)	t_{DC}, t_{DD}		6.0	ns

1. V_{DD} = 3 V to 3.6 V and T_A = –40 to 85 °C.

Ethernet characteristics

Table 55 shows the Ethernet operating voltage.

Table 55. Ethernet DC electrical characteristics

Symbol		Parameter	Min.[1]	Max.[1]	Unit
Input level	V_{DD}	Ethernet operating voltage	3.0	3.6	V

1. All the voltages are measured from the local ground potential.

Table 56 gives the list of Ethernet MAC signals for the SMI (station management interface) and *Figure 37* shows the corresponding timing diagram.

CAN (controller area network) interface

Refer to *Section 5.3.14: I/O port characteristics* for more details on the input/output alternate function characteristics (CANTX and CANRX).

5.3.18   12-bit ADC characteristics

Unless otherwise specified, the parameters given in *Table 59* are derived from tests performed under the ambient temperature, f_{PCLK2} frequency and V_{DDA} supply voltage conditions summarized in *Table 10*.

Table 59.   ADC characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DDA}	Power supply		1.8		3.6	V
V_{REF+}	Positive reference voltage		1.65		V_{DDA}	V
I_{VREF}	Current on the V_{REF} input pin		160[1]		220[1]	µA
f_{ADC}	ADC clock frequency	V_{DDA} = 1.8 to 2.4 V	0.6		15	MHz
		V_{DDA} = 2.4 to 3.6 V	0.6		30	MHz
f_{TRIG}[1]	External trigger frequency	f_{ADC} = 30 MHz			823	kHz
					17	$1/f_{ADC}$
V_{AIN}	Conversion voltage range[2]		0 (V_{SSA} or V_{REF-} tied to ground)		V_{REF+}	V
R_{AIN}[1]	External input impedance	See *Equation 1* for details			50	kΩ
R_{ADC}[1]	Sampling switch resistance				1	kΩ
C_{ADC}[1]	Internal sample and hold capacitor				8	pF
t_{lat}[1]	Injection trigger conversion latency	f_{ADC} = 30 MHz			0.100	µs
					3[3]	$1/f_{ADC}$
t_{latr}[1]	Regular trigger conversion latency	f_{ADC} = 30 MHz			0.067	µs
					2[3]	$1/f_{ADC}$
t_S[1]	Sampling time	f_{ADC} = 30 MHz	0.100		16	µs
			3		480	$1/f_{ADC}$
t_{STAB}[1]	Power-up time		0	0	1	µs
t_{CONV}[1]	Total conversion time (including sampling time)	f_{ADC} = 30 MHz 12-bit resolution	0.5		16.40	µs
		f_{ADC} = 30 MHz 10-bit resolution	0.43		16.34	µs
		f_{ADC} = 30 MHz 8-bit resolution	0.37		16.27	µs
		f_{ADC} = 30 MHz 6-bit resolution	0.3		16.20	µs
		9 to 492 (t_S for sampling +n-bit resolution for successive approximation)				$1/f_{ADC}$

Table 59.   ADC characteristics (continued)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_S[1]	Sampling rate (f_{ADC} = 30 MHz)	12-bit resolution Single ADC			2	Msps
		12-bit resolution Interleave Dual ADC mode			4	Msps
		12-bit resolution Interleave Triple ADC mode			6	Msps
I_{VREF+}	ADC V_{REF} DC current consumption in conversion mode	f_{ADC} = 30 MHz 3 sampling time 12-bit resolution			TBD	µA
		f_{ADC} = 30 MHz 480 sampling time 12-bit resolution			TBD	µA
I_{DDA}	ADC VDDA DC current consumption in conversion mode	f_{ADC} = 30 MHz 3 sampling time 12-bit resolution			TBD	µA
		f_{ADC} = 30 MHz 480 sampling time 12-bit resolution			TBD	µA

1. Based on characterization, not tested in production.

2. V_{REF+} is internally connected to V_{DDA} and V_{REF-} is internally connected to V_{SSA}.

3. For external triggers, a delay of $1/f_{PCLK2}$ must be added to the latency specified in *Table 59*.

Equation 1: R_{AIN} max formula

The formula above (*Equation 1*) is used to determine the maximum external impedance allowed for an error below 1/4 of LSB. Here N = 12 (from 12-bit resolution).

Table 60.   ADC accuracy [1]

Symbol	Parameter	Test conditions	Typ	Max[2]	Unit
ET	Total unadjusted error	f_{PCLK2} = 60 MHz, f_{ADC} = 30 MHz, R_{AIN} < 10 kΩ, V_{DDA} = 1.8 V to 3.6 V	±2	±5	LSB
EO	Offset error		±1.5	±2.5	
EG	Gain error		±1.5	±3	
ED	Differential linearity error		±1	±2	
EL	Integral linearity error		±1.5	±3	

1. Better performance could be achieved in restricted V_{DD}, frequency and temperature ranges.

2. Based on characterization, not tested in production.

Note: ADC accuracy vs. negative injection current: Injecting a negative current on any of the standard (non-robust) analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to

add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative currents.
Any positive injection current within the limits specified for $I_{INJ(PIN)}$ and $\Sigma I_{INJ(PIN)}$ in *Section 5.3.14* does not affect the ADC accuracy.
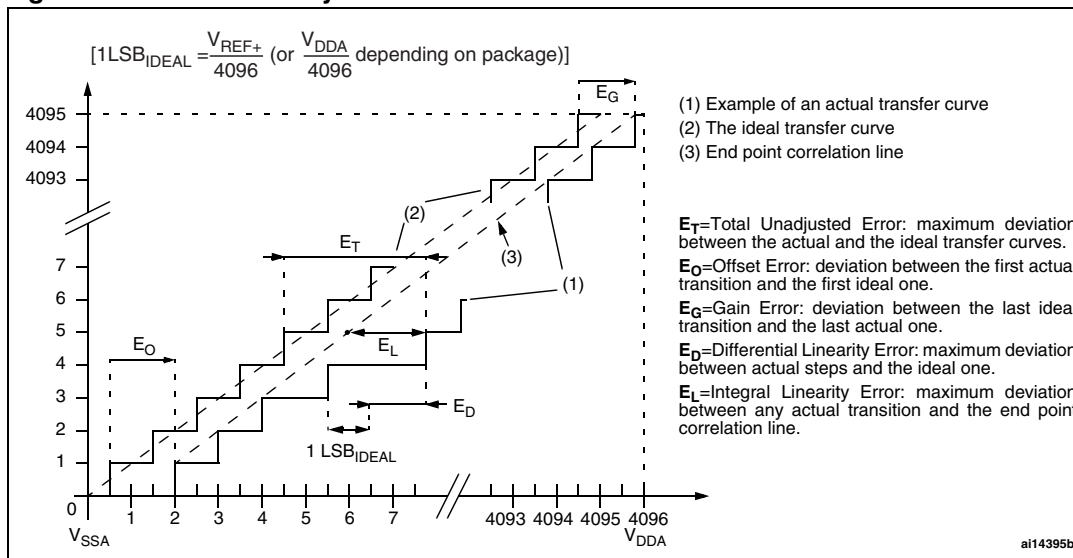

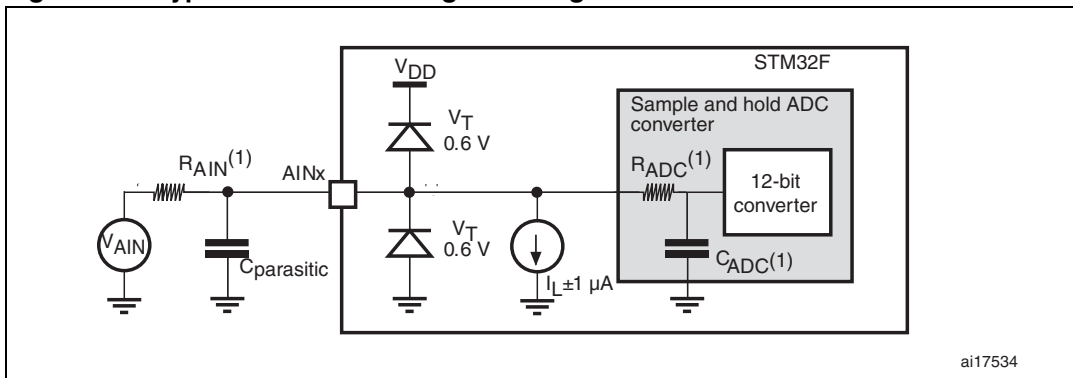

Figure 40.   ADC accuracy characteristics

Figure 41.   Typical connection diagram using the ADC

1.   Refer to *Table 59* for the values of R_{AIN}, R_{ADC} and C_{ADC}.

2. $C_{parasitic}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high $C_{parasitic}$ value downgrades conversion accuracy. To remedy this, f_{ADC} should be reduced.

General PCB design guidelines

Power supply decoupling should be performed as shown in *Figure 42* or *Figure 43*, depending on whether V_{REF+} is connected to V_{DDA} or not. The 10 nF capacitors should be ceramic (good quality). They should be placed them as close as possible to the chip.

Figure 42. Power supply and reference decoupling (V_{REF+} not connected to V_{DDA})
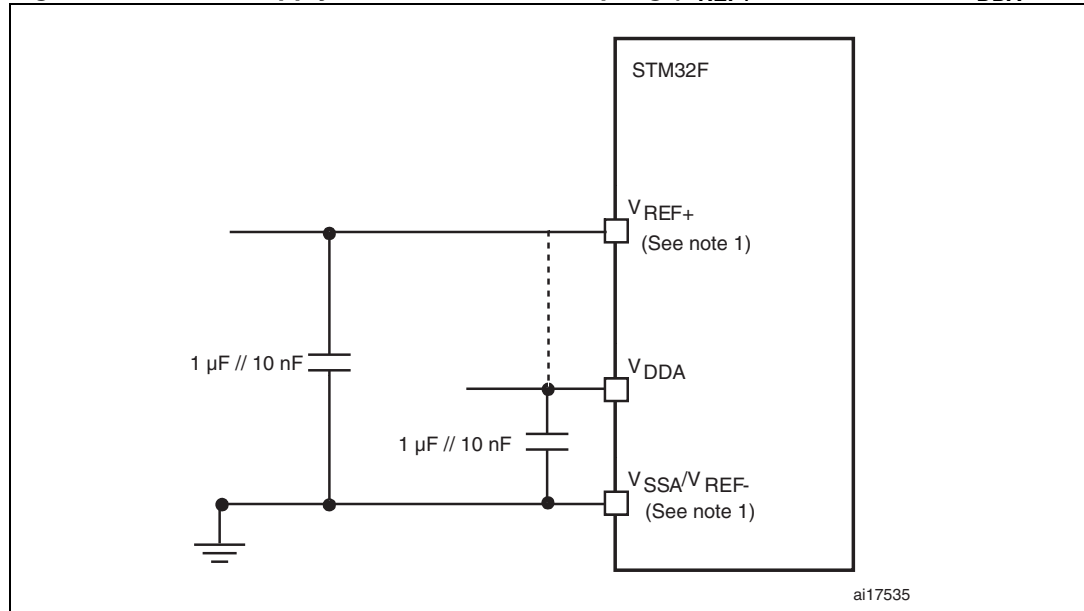

1. V_{REF+} and V_{REF-} inputs are available only on 100-pin packages.

Figure 43. Power supply and reference decoupling (V_{REF+} connected to V_{DDA})
1. V_{REF+} and V_{REF-} inputs are available only on 100-pin packages.

## 5.3.19 DAC electrical specifications

Table 61. DAC characteristics

Symbol	Parameter	Min	Typ	Max	Unit	Comments
V_{DDA}	Analog supply voltage	1.8		3.6	V	
V_{REF+}	Reference supply voltage	1.8		3.6	V	$V_{REF+} \leq V_{DDA}$
V_{SSA}	Ground	0		0	V	
R_{LOAD}[1]	Resistive load with buffer ON	5			kΩ	
R_O[1]	Impedance output with buffer OFF			15	kΩ	When the buffer is OFF, the Minimum resistive load between DAC_OUT and V_{SS} to have a 1% accuracy is 1.5 MΩ
C_{LOAD}[1]	Capacitive load			50	pF	Maximum capacitive load at DAC_OUT pin (when the buffer is ON).
DAC_OUT min[1]	Lower DAC_OUT voltage with buffer ON	0.2			V	It gives the maximum output excursion of the DAC. It corresponds to 12-bit input code (0x0E0) to (0xF1C) at V_{REF+} = 3.6 V and (0x1C7) to (0xE38) at V_{REF+} = 1.8 V
DAC_OUT max[1]	Higher DAC_OUT voltage with buffer ON			$V_{DDA} - 0.2$	V	
DAC_OUT min[1]	Lower DAC_OUT voltage with buffer OFF		0.5		mV	It gives the maximum output excursion of the DAC.
DAC_OUT max[1]	Higher DAC_OUT voltage with buffer OFF			$V_{REF+} - 1LSB$	V	
I_{VREF+}	DAC DC V_{REF} current consumption in quiescent mode (Standby mode)			220	µA	With no load, worst code (0xF1C) at V_{REF+} = 3.6 V in terms of DC consumption on the inputs
I_{DDA}	DAC DC VDDA current consumption in quiescent mode (Standby mode)			380	µA	With no load, middle code (0x800) on the inputs
				480	µA	With no load, worst code (0xF1C) at V_{REF+} = 3.6 V in terms of DC consumption on the inputs
DNL[2]	Differential non linearity Difference between two consecutive code-1LSB)			±0.5	LSB	Given for the DAC in 10-bit configuration.
				±2	LSB	Given for the DAC in 12-bit configuration.
INL[2]	Integral non linearity (difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 1023)			±1	LSB	Given for the DAC in 10-bit configuration.
				±4	LSB	Given for the DAC in 12-bit configuration.

Table 61.   DAC characteristics (continued)

Symbol	Parameter	Min	Typ	Max	Unit	Comments
Offset[2]	Offset error (difference between measured value at Code (0x800) and the ideal value = V_{REF+}/2)			±10	mV	Given for the DAC in 12-bit configuration
				±3	LSB	Given for the DAC in 10-bit at V_{REF+} = 3.6 V
				±12	LSB	Given for the DAC in 12-bit at V_{REF+} = 3.6 V
Gain error[2]	Gain error			±0.5	%	Given for the DAC in 12bit configuration
$t_{SETTLING}$[2]	Settling time (full scale: for a 10-bit input code transition between the lowest and the highest input codes when DAC_OUT reaches final value ±4LSB	3		4	µs	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ kΩ
THD[2]	Total Harmonic Distortion Buffer ON				dB	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ kΩ
Update rate[1]	Max frequency for a correct DAC_OUT change when small variation in the input code (from code i to i+1LSB)			1	MS/s	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ kΩ
t_{WAKEUP}[2]	Wakeup time from off state (Setting the ENx bit in the DAC Control register)		6.5	10	µs	$C_{LOAD} \leq 50$ pF, $R_{LOAD} \geq 5$ kΩ input code between lowest and highest possible ones.
PSRR+ [1]	Power supply rejection ratio (to V_{DDA}) (static DC measurement)		–67	–40	dB	No R_{LOAD}, $C_{LOAD} = 50$ pF

1.   Guaranteed by design, not tested in production.

2.   Guaranteed by characterization, not tested in production.

Figure 44.   12-bit buffered /non-buffered DAC
1.   The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC_CR register.

5.3.20 Temperature sensor characteristics

Table 62. TS characteristics

Symbol	Parameter	Min	Typ	Max	Unit
T_L[1]	V_{SENSE} linearity with temperature		± 1	± 2	°C
Avg_Slope[1]	Average slope		2.5		mV/°C
V_{25}[1]	Voltage at 25 °C		0.76		V
t_{START}[2]	Startup time	4		10	µs
T_{S_temp}[3][2]	ADC sampling time when reading the temperature 1°C accuracy	16			µs

1. Based on characterization, not tested in production.

2. Guaranteed by design, not tested in production.

3. Shortest sampling time can be determined in the application by multiple iterations.

5.3.21 V_{BAT} monitoring characteristics

Table 63. V_{BAT} monitoring characteristics

Symbol	Parameter	Min	Typ	Max	Unit
R[1]	Resistor bridge for V_{BAT}		TBD		KOhm
Q[1]	Ratio on V_{BAT} measurement		2		
Er[1]	Error on Q	-1		+1	%
T_{S_vbat}[2][2]	ADC sampling time when reading the V_{BAT} 1mV accuracy	TBD			µs

1. Guaranteed by design, not tested in production.

2. Shortest sampling time can be determined in the application by multiple iterations.

5.3.22 Embedded reference voltage

The parameters given in *Table 64* are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in *Table 10*.

Table 64. Embedded internal reference voltage

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{REFINT}	Internal reference voltage	−40 °C < T_A < +105 °C	1.16	1.20	1.26	V
		−40 °C < T_A < +85 °C	1.16	1.20	1.24	V
$T_{S\_vrefint}$[1]	ADC sampling time when reading the internal reference voltage			5.1	TBD[2]	µs

Table 64.   Embedded internal reference voltage

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{RERINT}[2]	Internal reference voltage spread over the temperature range	V_{DD} = 3 V ±10 mV			10	mV
T_{Coeff}[2]	Temperature coefficient				100	ppm/°C

1. Shortest sampling time can be determined in the application by multiple iterations.

2. Guaranteed by design, not tested in production.

5.3.23   FSMC characteristics

Asynchronous waveforms and timings

Figure 45 through *Figure 48* represent asynchronous waveforms and *Table 65* through *Table 68* provide the corresponding timings. The results shown in these tables are obtained with the following FSMC configuration:

● AddressSetupTime = 0

● AddressHoldTime = 1

● DataSetupTime = 1

Figure 45.   Asynchronous non-multiplexed SRAM/PSRAM/NOR read waveforms
1. Mode 2/B, C and D only. In Mode 1, FSMC_NADV is not used.

Table 65. Asynchronous non-multiplexed SRAM/PSRAM/NOR read timings[1] [2]

Symbol	Parameter	Min	Max	Unit
$t_{w(NE)}$	FSMC_NE low time	$5T_{HCLK} - 1.5$	$5T_{HCLK} + 2$	ns
$t_{v(NOE\_NE)}$	FSMC_NEx low to FSMC_NOE low	0.5	1.5	ns
$t_{w(NOE)}$	FSMC_NOE low time	$5T_{HCLK} - 1.5$	$5T_{HCLK} + 1.5$	ns
$t_{h(NE\_NOE)}$	FSMC_NOE high to FSMC_NE high hold time	−1.5		ns
$t_{v(A\_NE)}$	FSMC_NEx low to FSMC_A valid		7	ns
$t_{h(A\_NOE)}$	Address hold time after FSMC_NOE high	0.1		ns
$t_{v(BL\_NE)}$	FSMC_NEx low to FSMC_BL valid		0	ns
$t_{h(BL\_NOE)}$	FSMC_BL hold time after FSMC_NOE high	0		ns
$t_{su(Data\_NE)}$	Data to FSMC_NEx high setup time	$2T_{HCLK} + 25$		ns
$t_{su(Data\_NOE)}$	Data to FSMC_NOEx high setup time	$2T_{HCLK} + 25$		ns
$t_{h(Data\_NOE)}$	Data hold time after FSMC_NOE high	0		ns
$t_{h(Data\_NE)}$	Data hold time after FSMC_NEx high	0		ns
$t_{v(NADV\_NE)}$	FSMC_NEx low to FSMC_NADV low		5	ns
$t_{w(NADV)}$	FSMC_NADV low time		$T_{HCLK} + 1.5$	ns

1. C_L = 15 pF.
2. Based on characterization, not tested in production.

Figure 46. Asynchronous non-multiplexed SRAM/PSRAM/NOR write waveforms
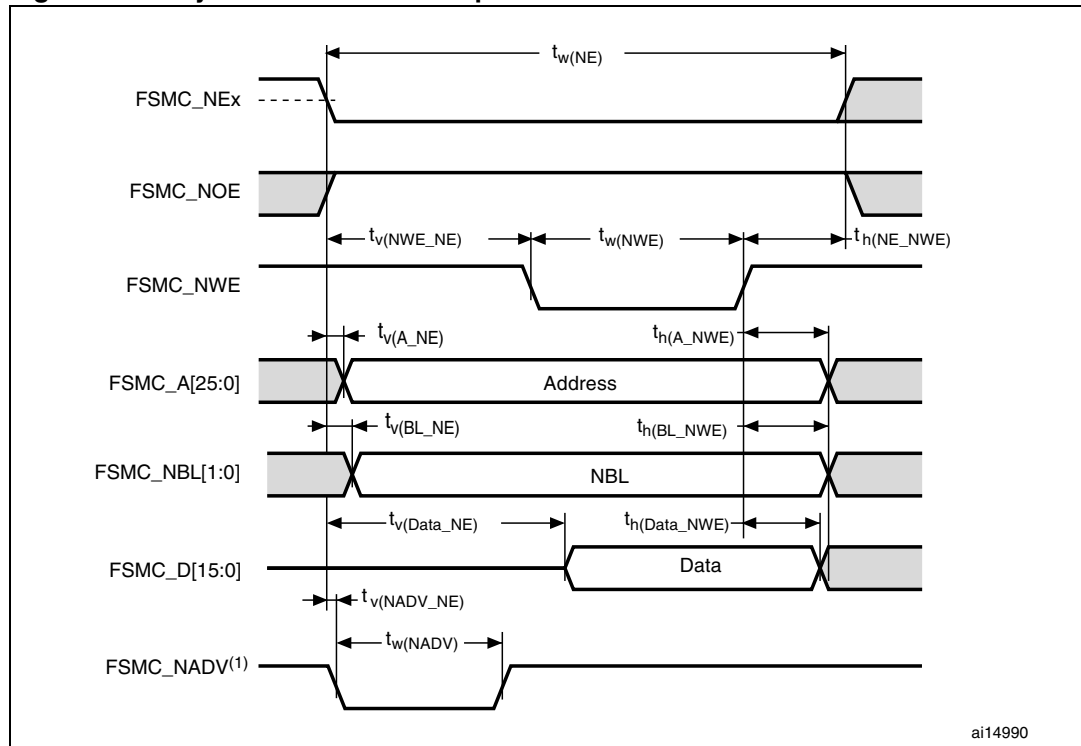

1. Mode 2/B, C and D only. In Mode 1, FSMC_NADV is not used.

Table 66.   Asynchronous non-multiplexed SRAM/PSRAM/NOR write timings[1][2]

Symbol	Parameter	Min	Max	Unit
$t_{w(NE)}$	FSMC_NE low time	$3T_{HCLK} - 1$	$3T_{HCLK} + 2$	ns
$t_{v(NWE\_NE)}$	FSMC_NEx low to FSMC_NWE low	$T_{HCLK} - 0.5$	$T_{HCLK} + 1.5$	ns
$t_{w(NWE)}$	FSMC_NWE low time	$T_{HCLK} - 0.5$	$T_{HCLK} + 1.5$	ns
$t_{h(NE\_NWE)}$	FSMC_NWE high to FSMC_NE high hold time	T_{HCLK}		ns
$t_{v(A\_NE)}$	FSMC_NEx low to FSMC_A valid		7.5	ns
$t_{h(A\_NWE)}$	Address hold time after FSMC_NWE high	T_{HCLK}		ns
$t_{v(BL\_NE)}$	FSMC_NEx low to FSMC_BL valid		1.5	ns
$t_{h(BL\_NWE)}$	FSMC_BL hold time after FSMC_NWE high	$T_{HCLK} - 0.5$		ns
$t_{v(Data\_NE)}$	FSMC_NEx low to Data valid		$T_{HCLK} + 7$	ns
$t_{h(Data\_NWE)}$	Data hold time after FSMC_NWE high	T_{HCLK}		ns
$t_{v(NADV\_NE)}$	FSMC_NEx low to FSMC_NADV low		5.5	ns
$t_{w(NADV)}$	FSMC_NADV low time		$T_{HCLK} + 1.5$	ns

1. C_L = 15 pF.

2. Based on characterization, not tested in production.

Synchronous waveforms and timings

Figure 49 through *Figure 52* represent synchronous waveforms and *Table 70* through *Table 72* provide the corresponding timings. The results shown in these tables are obtained with the following FSMC configuration:

● BurstAccessMode = FSMC_BurstAccessMode_Enable;

● MemoryType = FSMC_MemoryType_CRAM;

● WriteBurst = FSMC_WriteBurst_Enable;

● CLKDivision = 1; (0 is not supported, see the STM32F20xxx/21xxx reference manual)

● DataLatency = 1 for NOR Flash; DataLatency = 0 for PSRAM

Figure 49. Synchronous multiplexed NOR/PSRAM read timings
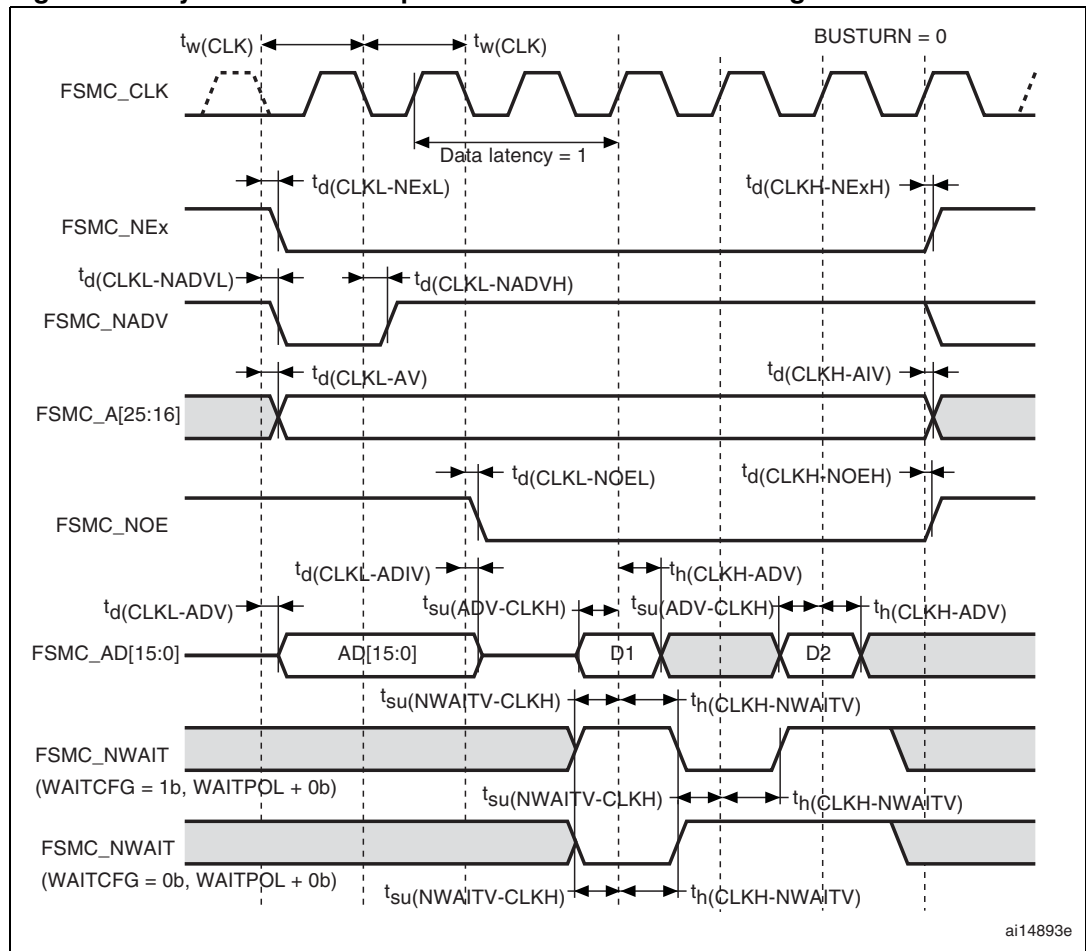

Table 69.   Synchronous multiplexed NOR/PSRAM read timings[1][2]

Symbol	Parameter	Min	Max	Unit
$t_{w(CLK)}$	FSMC_CLK period	27.7		ns
$t_{d(CLKL-NExL)}$	FSMC_CLK low to FSMC_NEx low (x = 0...2)		1.5	ns
$t_{d(CLKH-NExH)}$	FSMC_CLK high to FSMC_NEx high (x = 0...2)	$T_{HCLK} + 2$		ns

6.2 Thermal characteristics

The maximum chip-junction temperature, T_J max, in degrees Celsius, may be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

Where:

- T_A max is the maximum ambient temperature in °C,
- Θ_{JA} is the package junction-to-ambient thermal resistance, in °C/W,
- P_D max is the sum of P_{INT} max and $P_{I/O}$ max (P_D max = P_{INT} max + $P_{I/O}$max),
- P_{INT} max is the product of I_{DD} and V_{DD}, expressed in Watts. This is the maximum chip internal power.

$P_{I/O}$ max represents the maximum power dissipation on output pins where:

$P_{I/O}$ max = $\Sigma (V_{OL} \times I_{OL}) + \Sigma((V_{DD} - V_{OH}) \times I_{OH})$,

taking into account the actual V_{OL} / I_{OL} and V_{OH} / I_{OH} of the I/Os at low and high level in the application.
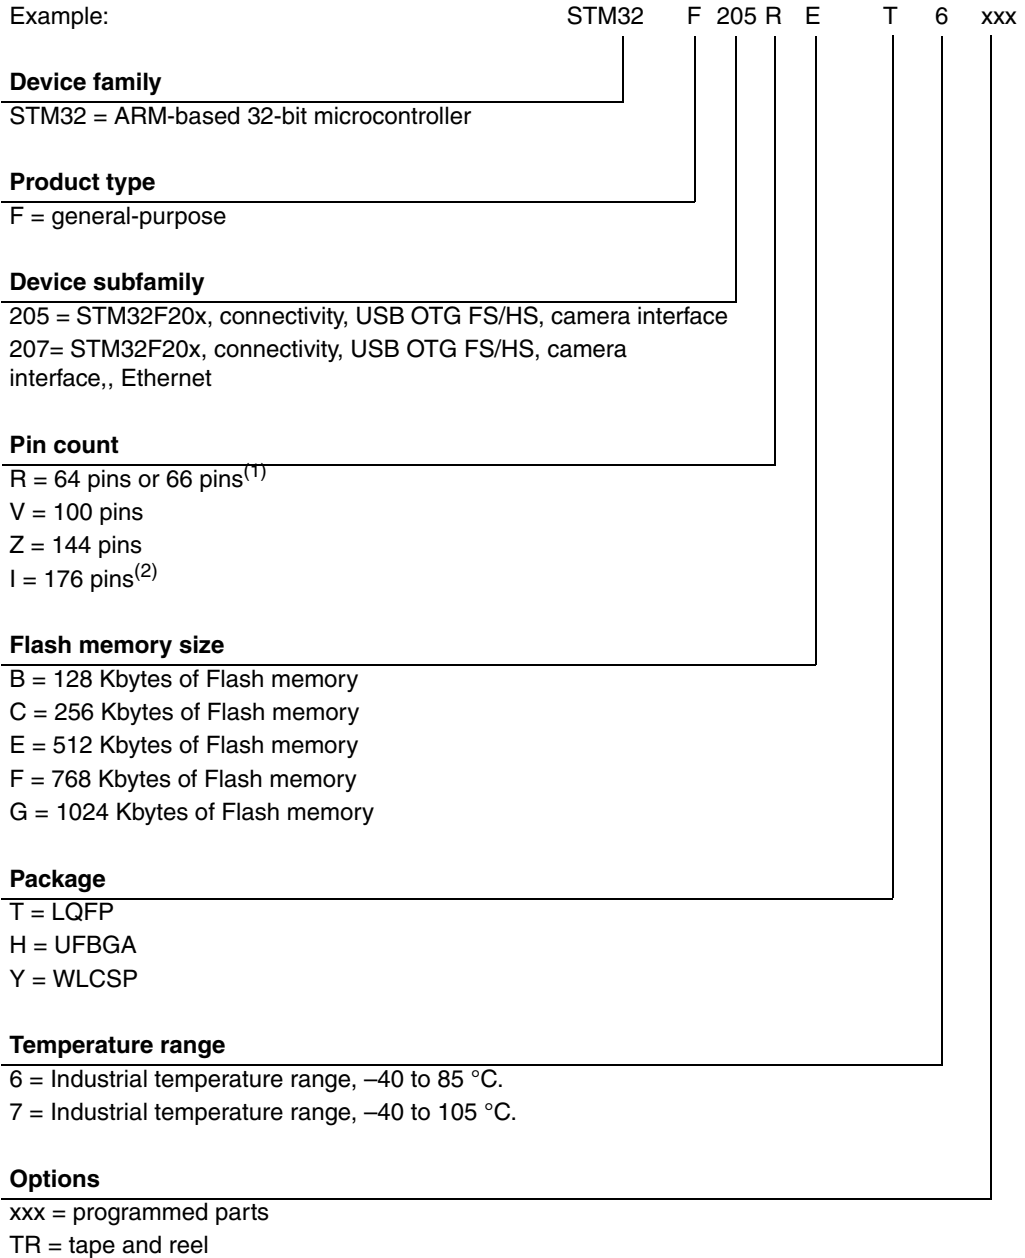

Table 84.   Package thermal characteristics

Symbol	Parameter	Value	Unit
Θ_{JA}	**Thermal resistance junction-ambient** LQFP 64 - 10 × 10 mm / 0.5 mm pitch	45	°C/W
	Thermal resistance junction-ambient WLCSP64+2 - 0.400 mm pitch	51	
	Thermal resistance junction-ambient LQFP 100 - 14 × 14 mm / 0.5 mm pitch	46	
	Thermal resistance junction-ambient LQFP 144 - 20 × 20 mm / 0.5 mm pitch	40	
	Thermal resistance junction-ambient LQFP 176 - 24 × 24 mm / 0.5 mm pitch	38	
	Thermal resistance junction-ambient UFBGA176 - 10× 10 mm / 0.5 mm pitch	39

7 Part numbering

Table 85.   Ordering information scheme

Example: STM32   F 205 R   E   T   6   xxx

Device family

STM32 = ARM-based 32-bit microcontroller

Product type

F = general-purpose

Device subfamily

205 = STM32F20x, connectivity, USB OTG FS/HS, camera interface

207= STM32F20x, connectivity, USB OTG FS/HS, camera interface,, Ethernet

Pin count

R = 64 pins or 66 pins[(1)]

V = 100 pins

Z = 144 pins

I = 176 pins[(2)]

Flash memory size

B = 128 Kbytes of Flash memory

C = 256 Kbytes of Flash memory

E = 512 Kbytes of Flash memory

F = 768 Kbytes of Flash memory

G = 1024 Kbytes of Flash memory

Package

T = LQFP

H = UFBGA

Y = WLCSP

Temperature range

6 = Industrial temperature range, –40 to 85 °C.

7 = Industrial temperature range, –40 to 105 °C.

Options

xxx = programmed parts

TR = tape and reel

1. The 66 pins is available on WLCSP package only.

2. The LQFP176 package is not in production. It is available only for development.

For a list of available options (speed, package, etc.) or for further information on any aspect of this device, please contact your nearest ST sales office.

Appendix A   Application block diagrams

A.1   Main applications versus package

Table 86 gives examples of configurations for each package.

Table 86.   Main applications versus package for STM32F207xx microcontrollers[1]

A.2   Application example with regulator off

Figure 74.   Regulator bypass/regulator off
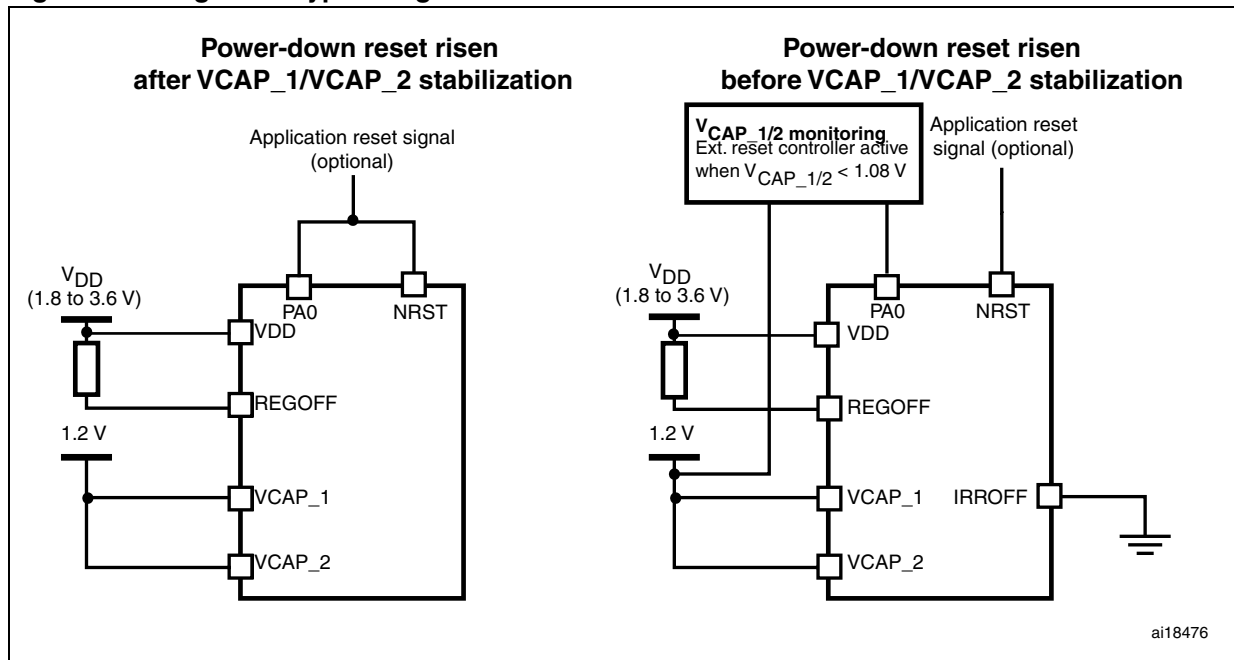

1.   This mode is available only on UFBGA176 and WLCSP64+2 packages.

Figure 75.   Regulator bypass/regulator off and internal reset off
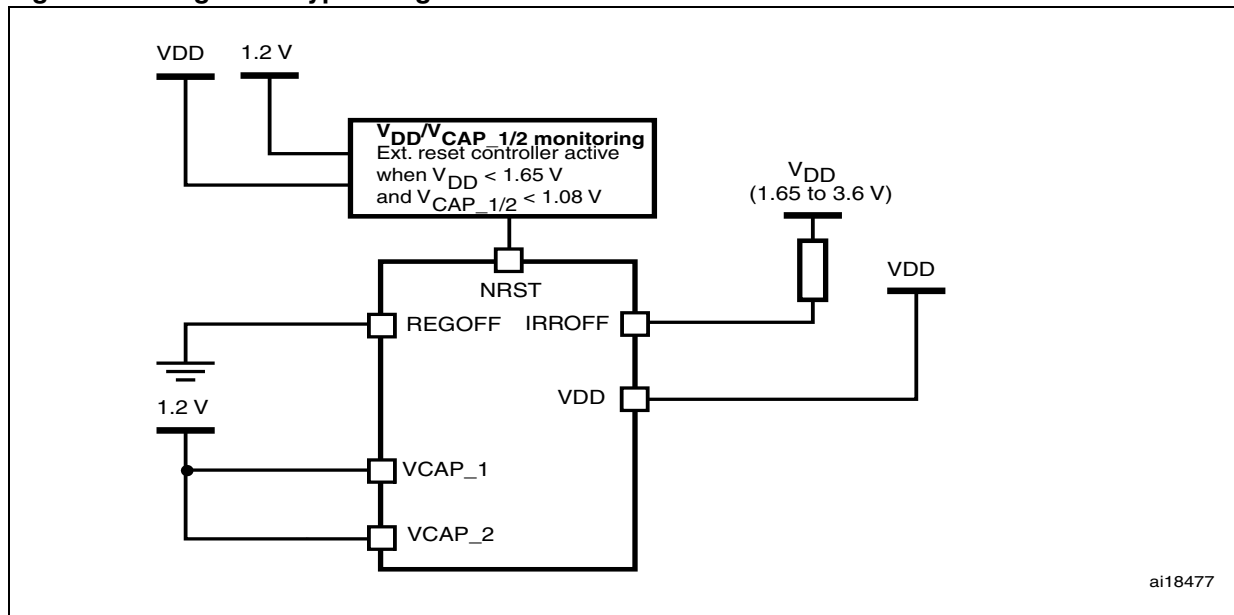

1.   This mode is available only on WLCSP64+2 package.

A.3   USB OTG full speed (FS) interface solutions

**Figure 76.   USB OTG FS peripheral-only connection**

Figure 77.   USB OTG FS host-only connection

1. STMPS2141STR/STULPI01B needed only if the application has to support a V_{BUS} powered device. A basic power switch can be used if 5 V are available on the application board.

Figure 78. OTG FS connection dual-role with internal PHY

1. External voltage regulator only needed when building a V_{BUS} powered device.

2. STMPS2141STR/STULPI01B needed only if the application has to support a V_{BUS} powered device. A basic power switch can be used if 5 V are available on the application board.

3. The same application can be developped using the OTG HS in FS mode to achieve enhanced performance thanks to the large Rx/Tx FIFO and to a dedicated DMA controller.

A.4 USB OTG high speed (HS) interface solutions

Figure 79. USB OTG HS peripheral-only connection
Figure 80. USB OTG HS host-only connection
1. STMPS2141STR/STULPI01B needed only if the application has to support a V_{BUS} powered device. A basic power switch can be used if 5 V are available on the application board.

Figure 81. OTG HS connection dual-role with external PHY
1. It is possible to use MCO1 or MCO2 to save a crystal. It is however not mandatory to clock the STM32F20x with a 24 or 26 MHz crystal when using USB HS. The above figure only shows an example of a possible connection.

A.5 Complete audio player solutions

Two solutions are offered, illustrated in *Figure 82* and *Figure 83*.

Figure 82 shows storage media to audio DAC/amplifier streaming using a software Codec. This solution implements an audio crystal to provide audio class I^2S accuracy on the master clock (0.5% error maximum, see the Serial peripheral interface section in the reference manual for details).

Figure 82. Complete audio player solution 1
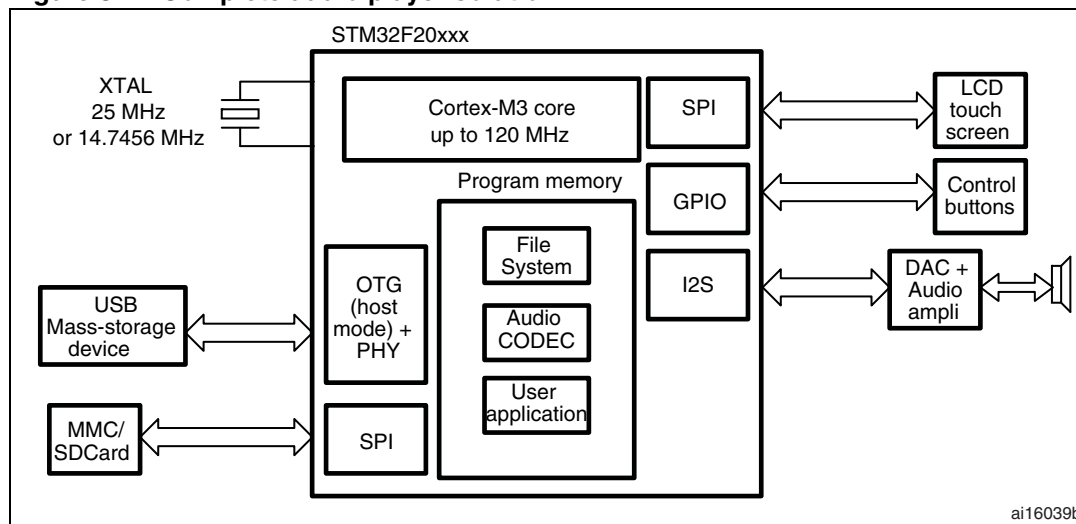

Figure 83 shows storage media to audio Codec/amplifier streaming with SOF synchronization of input/output audio streaming using a hardware Codec.

Figure 83. Complete audio player solution 2
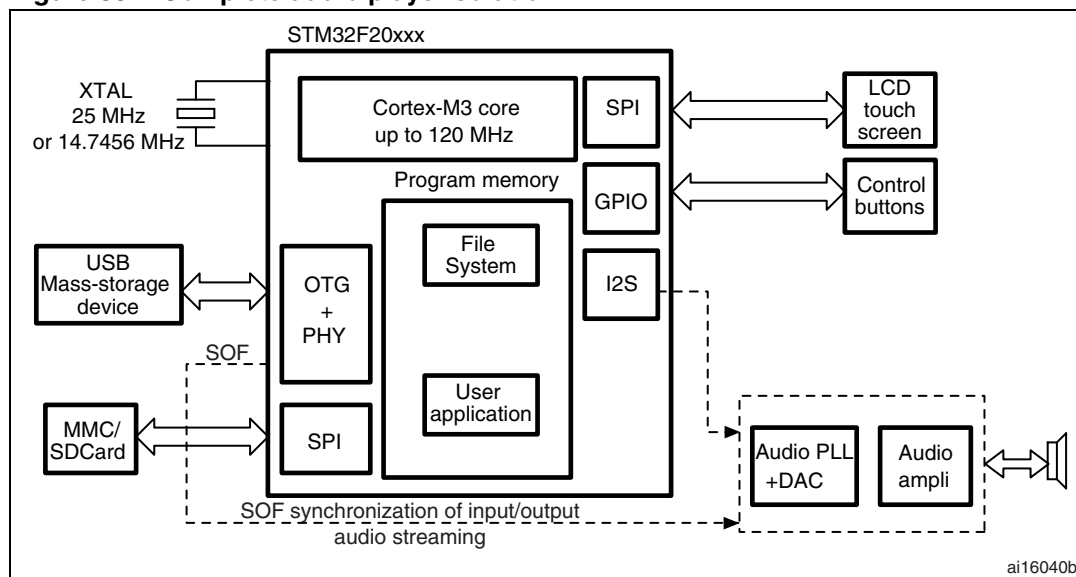

**Figure 84.   Audio player solution using PLL, PLLI2S, USB and 1 crystal**

Figure 85.   Audio PLL (PLLI2S) providing accurate I2S clock

$$I2S\_MCK = 256 \times F_{SAUDIO}$$

11.2896 MHz for 44.1 kHz
12.2880 MHz for 48.0 kHz

Figure 86. Master clock (MCK) used to drive the external audio DAC

1. I2S_SCK is the I2S serial clock to the external audio DAC (not to be confused with I2S_CK).

Figure 87. Master clock (MCK) not used to drive the external audio DAC

1. I2S_SCK is the I2S serial clock to the external audio DAC (not to be confused with I2S_CK).

Revision history

Table 87.   Document revision history

Date	Revision	Changes
05-Jun-2009	1	Initial release.
09-Oct-2009	2	Document status promoted from Target specification to Preliminary data. In *Table 5: STM32F20x pin and ball definitions*: – *Note 4* updated – V_{DD_SA} and V_{DD_3} pins inverted (*Figure 11: STM32F20x LQFP100 pinout*, *Figure 12: STM32F20x LQFP144 pinout* and *Figure 13: STM32F20x LQFP176 pinout* corrected accordingly). *Section 6.1: Package mechanical data* changed to LQFP with no exposed pad.
01-Feb-2010	3	LFBGA144 package removed. STM32F203xx part numbers removed. Part numbers with 128 and 256 Kbyte Flash densities added. Encryption features removed. PC13-TAMPER-RTC renamed to PC13-RTC_AF1 and PI8-TAMPER-RTC renamed to PI8-RTC_AF2.

Table 87.   Document revision history (continued)

Date	Revision	Changes
13-Jul-2010	4	Renamed high-speed SRAM, system SRAM.
		Removed combination: 128 KBytes Flash memory in LQFP144.
		Added UFBGA176 package. Added note 1 related to LQFP176 package in *Table 2*, *Figure 13*, and *Table 85*.
		Added information on ART accelerator and audio PLL (PLLI2S).
		Added *Table 4: USART feature comparison*.
		Several updates on *Table 5: STM32F20x pin and ball definitions* and *Table 6: Alternate function mapping*. ADC, DAC, oscillator, RTC_AF, WKUP and VBUS signals removed from alternate functions and moved to the "other functions" column in *Table 5: STM32F20x pin and ball definitions*.
		TRACESWO added in *Figure 4: STM32F20x block diagram*, *Table 5: STM32F20x pin and ball definitions*, and *Table 6: Alternate function mapping*.
		XTAL oscillator frequency updated on cover page, in *Figure 4: STM32F20x block diagram* and in *Section 2.2.12: External interrupt/event controller (EXTI)*.
		Updated list of peripherals used for boot mode in *Section 2.2.14: Boot modes*.
		Added Regulator bypass mode in *Section 2.2.17: Voltage regulator*, and *Section 5.3.3: Operating conditions at power-up / power-down in regulator bypass mode*.
		Updated *Section 2.2.18: Real-time clock (RTC), backup SRAM and backup registers*.
		Added *Note Note:* in *Section 2.2.19: Low-power modes*.
		Added SPI TI protocol in *Section 2.2.28: Serial peripheral interface (SPI)*.
		Added USB OTG_FS features in *Section 2.2.33: Universal serial bus on-the-go full-speed (OTG_FS)*.
		Updated V_{CAP_1} and V_{CAP_2} capacitor value to 2.2 µF in *Figure 18: Power supply scheme*.
		Removed DAC, modified ADC limitations, and updated I/O compensation for 1.8 to 2.1 V range in *Table 11: Limitations depending on the operating power supply range*.
		Added V_{BORL}, V_{BORM}, V_{BORH} and I_{RUSH} in *Table 14: Embedded reset and power control block characteristics*.
		Removed table Typical current consumption in Sleep mode with Flash memory in Deep power down mode. Merged typical and maximum current consumption sections and added *Table 15: Typical and maximum current consumption in Run mode, code with data processing running from Flash*, *Table 16: Typical and maximum current consumption in Run mode, code with data processing running from RAM, Table 17: Typical and maximum current consumption in Sleep mode, Table 18: Typical and maximum current consumptions in Stop mode, Table 19: Typical and maximum current consumptions in Standby mode*, and *Table 20: Typical and maximum current consumptions in VBAT mode*.
		Update *Table 29: Main PLL characteristics* and added *Section 5.3.10: PLL spread spectrum clock generation (SSCG) characteristics*.

Table 87.   Document revision history (continued)

Date	Revision	Changes
13-Jul-2010	4 (continued)	Added *Note 6* for CIO in *Table 40: I/O static characteristics*. Updated *Section 5.3.16: TIM timer characteristics*. Added T_{NRST_OUT} in *Table 43: NRST pin characteristics*. Updated *Table 46: I2C characteristics*. Removed 8-bit data in and data out waveforms from *Figure 36: ULPI timing diagram*. Removed note related to ADC calibration in *Table 60*. *Section 5.3.18: 12-bit ADC characteristics*: ADC characteristics tables merged into one single table; tables ADC conversion time and ADC accuracy removed. Updated *Table 61: DAC characteristics*. Updated *Section 5.3.20: Temperature sensor characteristics* and *Section 5.3.21: VBAT monitoring characteristics*. Update *Section 5.3.24: Camera interface (DCMI) timing specifications*. Added *Section 5.3.25: SD/SDIO MMC card host interface (SDIO) characteristics*, and *Section 5.3.26: RTC characteristics*. Added *Section 6.2: Thermal characteristics*. Updated *Table 82: LQFP176 - Low profile quad flat package 24 × 24 × 1.4 mm package mechanical data* and *Figure 72: LQFP176 - Low profile quad flat package 24 × 24 × 1.4 mm, package outline*. Changed tape and reel code to TX in *Table 85: Ordering information scheme*. Added *Table 86: Main applications versus package for STM32F207xx microcontrollers*. Updated figures in Appendix *A.3: USB OTG full speed (FS) interface solutions* and *A.4: USB OTG high speed (HS) interface solutions*. Updated *Figure 84: Audio player solution using PLL, PLLI2S, USB and 1 crystal* and *Figure 85: Audio PLL (PLLI2S) providing accurate I2S clock*.

Table 87.   Document revision history (continued)

Date	Revision	Changes
25-Nov-2010	5	Update I/Os in *Section : Features*. Added WLCSP66(64+2) package. Added note 1 related to LQFP176 on cover page. Added trademark for ART accelerator. Updated *Section 2.2.3: Adaptive real-time memory accelerator (ART Accelerator™)*. Updated *Figure 5: Multi-AHB matrix*. Added case of BOR inactivation using IRROFF on WLCSP devices in *Section 2.2.16: Power supply supervisor*. Reworked *Section 2.2.17: Voltage regulator* to clarify regulator off modes. Renamed PDROFF, IRROFF in the whole document. Added *Section 2.2.20: VBAT operation*. Updated LIN and IrDA features for UART4/5 in *Table 4: USART feature comparison*. *Table 5: STM32F20x pin and ball definitions*: Modified V_{DD_3} pin, and added note related to the FSMC_NL pin; renamed BYPASS-REG REGOFF, and add IRROFF pin; renamed USART4/5 UART4/5. USART4 pins renamed UART4. Changed V_{SS_SA} to V_{SS}, and V_{DD_SA} pin reserved for future use. Updated maximum HSE crystal frequency to 26 MHz. *Section 5.2: Absolute maximum ratings*: Updated V_{IN} minimum and maximum values and note for non-five-volt tolerant pins in *Table 7: Voltage characteristics*. Updated $I_{INJ(PIN)}$ maximum values and related notes in *Table 8: Current characteristics*. Updated V_{DDA} minimum value in *Table 10: General operating conditions*. Added *Note 2* Updated Maximum CPU frequency in *Table 11: Limitations depending on the operating power supply range*, and added *Figure 20: Number of wait states versus fCPU and VDD range*. Added brownout level 1, 2, and 3 thresholds in *Table 14: Embedded reset and power control block characteristics*. Changed f_{OSC_IN} maximum value in *Table 24: HSE 4-26 MHz oscillator characteristics*. Changed f_{PLL_IN} maximum value in *Table 29: Main PLL characteristics*, and updated jitter parameters in *Table 30: PLLI2S (audio PLL) characteristics*. *Section 5.3.14: I/O port characteristics*: updated V_{IH} and V_{IL} in *Table 40: I/O static characteristics*. Added *Note 1* below *Table 41: Output voltage characteristics*. Updated R_{PD} and R_{PU} parameter description in *Table 51: USB OTG FS DC electrical characteristics*. Updated V_{REF+} minimum value in *Table 59: ADC characteristics*. Updated *Table 64: Embedded internal reference voltage*. Removed Ethernet and USB2 for 64-pin devices in *Table 86: Main applications versus package for STM32F207xx microcontrollers*. Added *A.2: Application example with regulator off*, removed "OTG FS connection with external PHY" figure, updated *Figure 77*, *Figure 78*, and *Figure 80* to add STULPI01B.

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZED ST REPRESENTATIVE, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
